To who concerns,

I do not think enough consideration of the available area already available, and could be available, for the installation of P.V. installations. These can be installed on domestic building as well on the roofs of small to medium size business. Each one of these installations will earn money for the local economy , not some international organization that a large installation are likely to do. Together with the use of batteries, which are whose price is falling rapidly, will enable a distribute energy system to develop, with the advantage of stabilizing the local energy supply. These is already being by the Nation Grid in certain areas.

I could see a system that could develop with the right political will whereby villages, and small towns, had batteries, to control the input, and output electric energy system of that center of population.
