Dear NDF, WIND 'FARMING' (hunter-gathering)

As a source of main electricity? Rubbish!

Why? Well you are 'obviously' intelligent so it is obvious, that a commodity required immediately in the correct quantity everywhere always ... wind some, somewhere, sometimes - a no brainer.

So why pursue it? Remembers a few months ago when a large part of the UK was BLACKED out - I seem to recall wind farm backups FAILED!

When I <sup>first</sup> heard about proposals for main electricity being produced this way I took little notice - all sorts of excuses are mused But after a while it became obvious - THEY REALLY MEANT IT!

Now, many years on, this bottom-of-the-list (almost off the page) system of main-electricity is still being pushed - why?

Have you ever read the book 'Hidden Agendas' - by Pilger? It doesn't do wind-power as such, but it certainly explains the process by which the UNTHINKABLE becomes the NORM. 'A lie

repeated often enough becomes the truth' - said another famous author - I am sure you have read the famous author of this!

Many years ago the process was begun - with climate change and the CO<sub>2</sub> cult: Wind, clean no CO<sub>2</sub>, almost free too - IT WOULD HELP TO FILL THE GAP AS CONVENTIONAL SYSTEMS PHASED OUT AND NEWER BETTER alternatives found.

Then without wind the LIGHTS WILL GO OUT (Reliance on wind ensured they did - REMEMBER THE BLACKOUT A FEW MONTHS AGO?)

The use of wind as a producer of mains electricity has always been a myth but most people don't know where electricity comes from - so just keep hinting at wind?

All along - a mixture of half-truths, lies and downright deliberate misinformation has been allowed to trickle out - The wording has changed from 'wind power' to 'alternative sources'. The announcement that 'to-day' wind generated more power than conventional systems! - Yes, but the latter and eventually the former wins!

I could 'talk' for pages about other systems, which have been deliberately overlooked eg. a Welsh tidal system - you know which. 'Smoothers' have been offered small protesting groups (small groups have no chance against the cartels who 'buy off' objectors (and perhaps 'buy up' political forces.) e.g. play areas for the children. Then there <sup>is</sup> the at first almost subliminal advertising on T.V. - all channels - 'filled' spots between programmes, which always includes whirling dervishes (as an M.P. called 'turbines' (aerogenerators))! and during progs with shots of background bearing no significance to the story setting - but very obvious 'wind farms'!

Why are areas set aside for 'turbine' parts moving on roads which culminate in areas which have been applied for, and refused, in beautiful country areas?

Why is wind 'power' (a nonsense) always included in 'renewable resources' - wind is a hunter-gatherer resource - it can't be 'farmed'! If included at all - it should be as a 'sometimes' bonus - as it is on farms and traffic signals.

The reason that aerogenerators have to be so big is that they are very inefficient - and the mechanics prevent really efficient ones being built (thank god!) - but now there is a new material which is being introduced into the design for mechanical components (the usual ones have proven unsuitable for the size of the 'turbine' and give lives very much less than predicted and outputs blighted by shutting down if the source, wind, is too strong! Unfortunately this new material may solve the problem but introduce a new one - limited resources and we, the world, will run out of it before it can become effective!

3

There are two tests for any man-made appliance - does it work, and how it looks - (1) MECHANICAL AND (2) AESTHETIC. Wind-turbines' FAIL miserably one (1) and not only fail on (2) but DESTROY surrounding aesthetics as well.

You know full well that resources developed at 'A' have either to be used there ~~or~~ moved i.e. pylons - so the destruction of landscape is assured at 'A' and at 'B' and everywhere between 'A' and 'B'!!

So why does the Welsh Government think or even contemplate large scale wind powered electrics? As I have tried to explain - THERE IS NO CASE FOR LARGE SCALE WIND TURBINES (the smaller scale local systems e.g. horizontal to feed local demand MAY be feasible but it requires the correct site.)

In the case of Mid Wales the argument seems to be that fewer people will be inconvenienced than the majority can enjoy the benefits without the inconvenience!

However, and I cannot make this point too strongly, MID WALES HAS ALREADY HAD ITS WATER PLUNDERED FOR THE BENEFIT OF OTHER AREAS. IT HAS LEFT NOT A MECHANICAL RESOURCE, TAKEN, BUT AN AESTHETIC ONE, THE LANDSCAPE

Mealy mouthed words describing the devastating impact that wind powered non-solution to our energy crisis may have - will in no way prevent the devastating effect on the main and growing resource of MID WALES - beauty and, whilst this RARE is being committed untold disruption to a peaceful area of Britain

I know that 'wind farms' destroy tourism and I could quote you one devastating result of off shore development let alone ON-SHORE - ~~an owner~~ an owner of a camp site overlooking the sea - went bankrupt within a few years of their construction. 'TURBINES' KILL TRADE AT HOME. The turbines are foreign (even the Danish manufacturers rely on exports!) they are costly, they don't work as described, and they are being foisted upon us by a relentless CARTER operating mainly silently in the houses of power - WE ARE NOT STUPID YOU KNOW!

Yours - angrily
