Proportion of people in Wales who had antibodies against COVID-19

Definitions

Quality and methodology information

Contact details

The antibody data presented is part of the Coronavirus (COVID-19) Infection Survey (CIS) which is run across the whole of the UK. The data can be used to identify individuals who have had the infection in the past or have developed antibodies as a result of vaccination.

The analysis presented on past infection and/or vaccination, is defined as testing positive for antibodies to SARS-CoV-2 based on findings from the COVID-19 Infection Survey. SARS-CoV-2 is the scientific name given to the specific virus that causes COVID-19.

Estimates of antibody positivity presented in this publication have been produced using a new model. Further information on the new method used to model antibody estimates can be found on the ONS website.

This publication also includes estimates of the percentage of people who have reported via the survey that they have received one or more doses of a COVID-19 vaccination.

Further information on these changes, along with estimates of antibody positivity broken down by age for each of the UK countries can be found on the [Office for National Statistics website](#).

Proportion of people in Wales who had antibodies against COVID-19

Between 8 and 14 March 2021, 50.5% (95% **credible interval**: 44.2% to 57.2%) of people aged 16 and over tested positive for antibodies to the coronavirus (COVID-19). This equates to 1 in 2 people aged 16 and over.

Though there is uncertainty with the estimates, it appears that there has been a sizeable increase in antibody rates recently. As more people become vaccinated the number of people with antibodies is likely to increase.

Antibody levels in the blood can decline over time, meaning that some people who have previously had COVID-19 may subsequently test negative for antibodies. For this reason, these figures should be regarded as estimates of monthly antibodies prevalence, not cumulative exposure.

Chart 1: Estimated percentage of the population in Wales testing positive for coronavirus (COVID-19) antibodies, December 2020 to March 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue bars give point estimates and the vertical lines indicate the 95% credible intervals. Estimates shown for 7 day periods from 7 December 2020 to 14 March 2021.

The modelled estimates suggest that both the antibody rate and percentage of people that have reported they have had at least one dose of a COVID vaccine continue to increase.

The vaccinations estimates are not the same as the published figures from [Public Health Wales](#) on recorded vaccinations and do not include residents of care homes. There will be differences between these modelled estimates and the official figures due to differences in coverage, methods and timeliness. The estimates produced from the survey are helpful to compare with other

characteristics, such as testing positive for antibodies.

Chart 2: Estimated percentage of the population in Wales reporting receipt of vaccination and testing positive for coronavirus (COVID-19) antibodies, December 2020 to March 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue line and shading represent the modelled trend and 95% credible intervals for people testing positive for antibodies (dark blue) and people reported having had at least one dose of a COVID vaccine (light blue).

Between 8 and 14 March, the percentage of people aged 80 years and over testing positive for antibodies was 79.2% (95% credible interval: 68.4% to 86.4%).

Antibody rates were high in those aged 65 years and over, with rates ranging from 79.2% to 88.7%. In contrast, the percentage of people testing positive for antibodies for those aged 16 to 64 years ranged from 33.7% to 50.7%.

It is noticeable that the proportion of people reporting they have had at least one dose of a COVID vaccine was also highest in the older age groups. Therefore it is likely that high antibody rates in these age groups are due to higher vaccination rates.

Caution should be taken in over-interpreting the latest estimates. Credible intervals are wide and the sample size is relatively low, meaning there is higher uncertainty in these figures.

Chart 3: Estimated percentage of the population in Wales reporting receipt of vaccination and testing positive for coronavirus (COVID-19) antibodies by age group, 8 to 14 March 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue bars give estimates for people testing positive for antibodies (blue) and that reported having had at least one dose of the COVID vaccine (dark blue) the horizontal lines indicate the 95% credible intervals. Estimates shown for the 7 day period from 8 to 14 March 2021.

as the community population. Residents in hospitals, care homes and/or other institutional settings are excluded.

Credible intervals

A credible interval gives an indication of the uncertainty of an estimate from data analysis. 95% credible intervals are calculated so that there is a 95% probability of the true value lying in the interval.

Positivity rate

The estimated proportion of people who test positive for antibodies against coronavirus (COVID-19) at a point in time.

Quality and methodology information

Estimates of antibody positivity presented in this publication have been produced using a **new model**. The new model is based on standardised Monday-Sunday surveillance weeks, as opposed to the 28-day periods previously reported on, enabling more timely weekly estimates to be produced. Estimates based on the new model are presented from 7 December 2020 onwards. The final week's modelled estimate is subject to more uncertainty as it is an incomplete week of data and therefore more likely to change when more data becomes available.

The analysis presented is based on blood test results taken from a randomly selected subsample of individuals aged 16 years and over, which are used to test for antibodies against SARS-CoV-2. This can be used to identify individuals who have had the infection in the past or have developed antibodies as a result of vaccination.

One way the body fights infections like COVID-19 is by producing small particles in the blood called antibodies. It takes between two and three weeks after infection or vaccination for the body to make enough antibodies to fight the

Get [information on copyright](#).

infection. Antibodies remain in the blood at low levels, although these levels can decline over time to the point that tests can no longer detect them. Having antibodies can help to prevent individuals from getting the same infection again.

The presence of antibodies is measured to understand who has had coronavirus (COVID-19) in the past and the impact of vaccinations. Once infected, the length of time antibodies remain at detectable levels in the blood is not fully known. It is also not yet known how having detectable antibodies, now or at some time in the past, affects the chance of getting COVID-19 again.

This publication also presents self-reported estimates of the percentage of people who have received one or more doses of a COVID-19 vaccination since 14 December 2020. These estimates are based on modelling of the people visited in the COVID-19 Infection Survey in the community in a particular time period. The estimates are then adjusted (post-stratified) to be representative of the population.

These estimates are not the same as the **published government figures** on recorded vaccinations and there may be differences between these modelled estimates and the official figures, which are updated more regularly. The estimates produced from the survey are helpful to compare with other characteristics, such as testing positive for antibodies.

The **UK coronavirus dashboard** includes daily data for the UK and each constituent country on the actual number of people who have received a COVID-19 vaccination. This is based on individual vaccination records (administrative data held by each nation) and should be used to understand progress of the vaccination programme across the UK.

Antibody data presented is a week behind vaccination data as there is a time lag on when antibody data is received, whereas vaccine data is self-reported and more readily available.

These statistics refer to infections reported in the community, by which we mean private households. These figures exclude infections reported in hospitals, care homes and/or other institutional settings. The population used in this analysis relates to the **community population** aged 16 years and over.

It is important to note that there is a significant degree of uncertainty with the estimates. This is because, despite a large sample of participants, the number of positive cases identified is small. Estimates are provided with 95% **credible** intervals to indicate the range within which we may be confident the true figure lies.

Further information on antibody test results is published by the **Office for National Statistics (ONS)** and includes antibody information for England, Wales, Scotland and Northern Ireland. The estimates for **Northern Ireland** and **Scotland** are published by the respective administrations, as we do here for Wales.

Further information about quality and methodology can be found on the **ONS website** and the survey pages on the **Oxford University site**.

More information about the **COVID-19 Infection Survey in Wales**.

Well-being of Future Generations Act (WFG)

The Well-being of Future Generations Act 2015 is about improving the social, economic, environmental and cultural wellbeing of Wales. The Act puts in place seven wellbeing goals for Wales. These are for a more equal, prosperous, resilient, healthier and globally responsible Wales, with cohesive communities and a vibrant culture and thriving Welsh language. Under section (10)(1) of the Act, the Welsh Ministers must (a) publish indicators ('national indicators') that must be applied for the purpose of measuring progress towards the achievement of the wellbeing goals, and (b) lay a copy of the national indicators before Senedd Cymru. The 46 national indicators were laid in March 2016.

Information on the indicators, along with narratives for each of the well-being goals and associated technical information is available in the **Wellbeing of Wales report**.

The statistics included in this release could also provide supporting narrative to the national indicators and be used by public services boards in relation to their local wellbeing assessments and local wellbeing plans.
