Proportion of people in Wales who had COVID-19

Estimates for the countries of the UK

Definitions

Quality and methodology information

Contact details

Antibody data for Wales is now published fortnightly in a separate release.

The Coronavirus (COVID-19) Infection Survey (CIS) is run across the whole of the UK and aims to estimate:

- how many people have the infection over a given time (positivity)
- how many new cases occur over a given period (incidence)
- how many people have antibodies to COVID-19

The survey helps track the extent of infection and transmission of COVID-19 among people in private residences, referred to as the **community population**.

Proportion of people in Wales who had COVID-19

For the week of 20 to 26 June 2021 it is estimated that 0.22% of the **community population** had COVID-19 (95% **credible interval**: 0.12% to 0.36%).

This equates to around 1 in 450 individuals (95% credible interval: 1 in 820 to 1 in 280), or an estimated 6,800 people in total (credible interval: 3,700 to 11,000).

The percentage of people testing positive in Wales has increased in the most recent week.

Since the estimates are based on a relatively low number of positive tests, caution should be taken in over-interpreting any small movements in the latest trend.

Further information on the classification of positive cases can be found on the [Office for National Statistics \(ONS\) website](#).

Please note that there is a greater lag in data from the infection survey than from other sources such as [Public Health Wales](#).

Chart 1: Official estimates of the percentage of the population in Wales testing positive for the coronavirus (COVID-19) on nose and throat swabs since 16 May 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue line and shading represent the modelled trend and 95% credible intervals based on the latest data. The point estimate and error bars are the official estimates published at the time. Estimates for the last few days of the series, shown as dashed lines in the chart, have more uncertainty.

Cases compatible with the Delta variant have increased in Wales in the most recent week. Cases compatible with the Alpha variant remain low in the most recent week, whilst the trend is uncertain for cases where the virus is too low for the variant to be identifiable.

Cases where the virus is too low for the variant to be identifiable are often due to

individuals having had the virus for a longer period of time.

Cases compatible with the Alpha variant, Delta variant and other variants continue to be monitored via the survey. Data on cases compliant with different variants can be found in the **technical dataset** on the ONS website.

Chart 2: Estimates of the percentage of positive cases compatible with the Delta variant and other positive cases since 16 May 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The lines and shading represent the modelled trend and 95% credible intervals based on the latest data for cases compatible with the new variant, not compatible with the new variant and those where the virus is too low for the variant to be identifiable. Estimates for the last few days of the series, where no central estimate is shown, have more uncertainty.

The percentage of people testing positive for COVID-19 by single year of age since 21 February 2021 for Wales, Northern Ireland and Scotland is provided in the **ONS dataset**.

Estimates for the countries of the UK

At the midpoint of the most recent week (20 to 26 June 2021), the estimated percentage of the community population with COVID-19 across the UK ranged from 0.15% in Northern Ireland to 0.68% in Scotland.

Rates have continued to increase across the UK in recent weeks, excluding Northern Ireland where the trend remains uncertain.

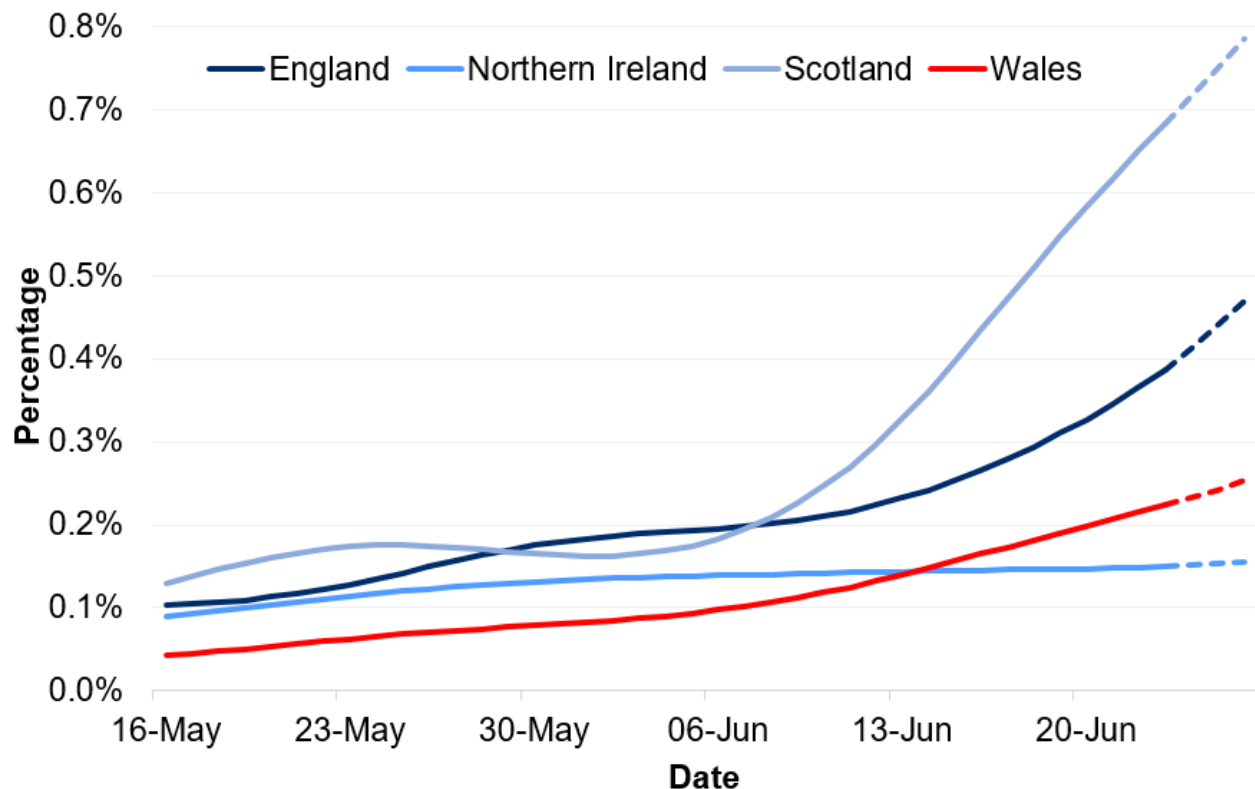

There is some uncertainty around the individual point estimates for the nations. Estimates for the last few days of the series, shown as dashed lines in the chart below, have more uncertainty.

Chart 3: Estimates of the percentage of the population in the UK countries testing positive for the coronavirus (COVID-19) on nose and throat swabs since 16 May 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS
 The lines represent the modelled trend based on the latest data. Estimates for the last few days of the series, shown as dashed lines in the chart, have more uncertainty.

Table 1: Positivity rates across UK countries for the week 20 to 26 June 2021

	Positivity rates (95% Credible Interval)		
Wales	0.22% (0.12 to 0.36)	1 in 450 people (1 in 820 to 1 in 280)	6,800 people (3,700 to 11,000)

**Positivity rates
(95% Credible Interval)**

England	0.39% (0.34 to 0.44)	1 in 260 people (1 in 290 to 1 in 230)	211,100 people (185,200 to 239,300)
Scotland	0.68% (0.50 to 0.90)	1 in 150 people (1 in 200 to 1 in 110)	35,900 people (26,500 to 47,200)
Northern Ireland	0.15% (0.06 to 0.30)	1 in 670 people (1 in 1,770 to 1 in 340)	2,800 people (1,000 to 5,500)

Definitions

Cases compatible with variants

Cases identified as being compatible with known variants of Covid-19 based on their genetic patterns. **Variants of Concern and Variants of Interest** have recently been relabelled by the World Health Organisation (WHO). Further information on the identification of variants in the survey can be found on the [ONS website](#).

Community population

This survey covers people living in private households only and this is referred to as the community population. Residents in hospitals, care homes and/or other institutional settings are excluded.

Confidence intervals

A confidence interval gives an indication of the degree of uncertainty of an estimate, showing the precision of a sample estimate. The 95% confidence intervals are calculated so that if we repeated the study many times, 95% of the time the true unknown value would lie between the lower and upper confidence limits. A wider interval indicates more uncertainty in the estimate. Overlapping confidence intervals indicate that there may not be a true difference between two estimates.

Credible intervals

A credible interval gives an indication of the uncertainty of an estimate from data analysis. 95% credible intervals are calculated so that there is a 95% probability of the true value lying in the interval.

Incidence

The number of new infections over a period of time.

Modelled estimates

Estimates of positivity from this survey are based on statistical modelling of the underlying data. The model smooths the series to understand the trend and is revised each week to incorporate new test results.

Point estimates

The headline point estimates are based on the modelled trend and are reflect the most representative reference point for the given week.

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-20-26-june-2021-html> for the latest version.

Get [information on copyright](#).

Positivity rate

The estimated proportion of people who test positive for coronavirus (COVID-19) at a point in time, with or without symptoms, based on nose and throat swabs.

Quality and methodology information

The results of the survey are based on self-administered nose and throat swabs provided by participants to the study. A subgroup of participants also provide blood test, taken by trained field staff.

As well as looking at overall **incidence**, **positivity** and antibody level, the survey will be used to examine the characteristics of those testing positive for COVID-19 and the extent to which those infected experience symptoms. The results are for private households only and do not apply to those in hospitals, care homes or other institutional settings. This is referred to as the **community population**.

The survey covers all the countries of the UK, enabling estimates to be calculated for each country individually, and in time the UK as a whole.

Fieldwork started first in England on 26 April 2020 meaning there is more cumulative data available for England enabling more detailed analysis at present. Fieldwork began in Wales on 29 June 2020 followed by Northern Ireland on 26 July 2020 and Scotland on 21 September 2020.

It is important to note that there is a significant degree of uncertainty with the estimates. This is because, despite a large sample of participants, the number of positive cases identified is small. Estimates are provided with 95% **credible** or **confidence** intervals to indicate the range within which we may be confident the true figure lies.

The **modelled estimates** are carried out afresh each week using the previous 6 weeks' data. The model works by smoothing the series to understand the trend and is revised each week to incorporate new test results. This means that the latest estimate for an earlier period may be different to the official estimate that

This document was downloaded from GOV.WALES and may not be the latest version.

Get [information on copyright](#).

was produced at the time. Chart 1 shows the latest modelled trend and the official **(point) estimates** that were published at the time.

The Office for National Statistics (ONS) publishes **weekly statistical bulletins** and references tables and periodic **statistical articles** which include results for England, Wales, Northern Ireland and Scotland as they become available. The estimates for **Northern Ireland** and **Scotland** are published by the respective administrations, as we do here for Wales.

Further information about quality and methodology can be found on the **ONS website** and the survey pages on the **Oxford University site**.

Well-being of Future Generations Act (WFG)

The Well-being of Future Generations Act 2015 is about improving the social, economic, environmental and cultural well-being of Wales. The Act puts in place seven well-being goals for Wales. These are for a more equal, prosperous, resilient, healthier and globally responsible Wales, with cohesive communities and a vibrant culture and thriving Welsh language. Under section (10)(1) of the Act, the Welsh Ministers must (a) publish indicators (“national indicators”) that must be applied for the purpose of measuring progress towards the achievement of the Well-being goals, and (b) lay a copy of the national indicators before Senedd Cymru. The 46 national indicators were laid in March 2016.

Information on the indicators, along with narratives for each of the well-being goals and associated technical information is available in the **Well-being of Wales report**.

Further information on the **Well-being of Future Generations (Wales) Act 2015**.

The statistics included in this release could also provide supporting narrative to the national indicators and be used by public services boards in relation to their local well-being assessments and local well-being plans.
