Introduction

Antibody data for Wales is now published fortnightly in a separate release.

The Coronavirus (COVID-19) Infection Survey (CIS) is run across the whole of the UK and aims to estimate:

- how many people have the infection over a given time (positivity)
- how many new cases occur over a given period (incidence)
- how many people have antibodies to COVID-19

The survey helps track the extent of infection and transmission of COVID-19

among people in private residences, referred to as the **community population**.

Proportion of people in Wales who had COVID-19

For the week of 23 to 29 January 2022 it is estimated that 4.57% of the **community population** had COVID-19 (95% **credible interval**: 3.94% to 5.24%).

This equates to around 1 in 20 individuals (95% credible interval: 1 in 25 to 1 in 20), or an estimated 139,000 people in total (credible interval: 119,800 to 159,300).

The percentage of people testing positive in Wales has increased in the most recent week.

Since the estimates are based on a relatively low number of positive tests, caution should be taken in over-interpreting any small movements in the latest trend.

Further information on the classification of positive cases can be found on the **Office for National Statistics (ONS) website**.

Please note that there is a greater lag in data from the infection survey than from other sources such as **Public Health Wales**.

This document was downloaded from GOV.WALES and may not be the latest version.

Chart 1: Official estimates of the percentage of the population in Wales testing positive for the coronavirus (COVID-19) on nose and throat swabs since 19 December 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue line and shading represent the modelled trend and 95% credible intervals based on the latest data. The point estimate and error bars are the official estimates published at the time. Estimates for the last few days of the series, shown as dashed lines in the chart, have more uncertainty.

Cases compatible with the Omicron variant, Delta variant and other variants continue to be monitored via the survey. Data on cases compliant with different variants can be found in the [technical dataset on the ONS website](#).

Infections compatible with the Omicron variant are the most common across all four UK countries. Because of this high proportion of a single variant, we have not included any breakdown by variant. We last [published our main variant analysis](#) on 14 January 2022, where more detail can be found. Infections by

variant will continue to be monitored and the analysis will be re-introduced if the situation changes.

The percentage of people testing positive for COVID-19 by single year of age since 19 December 2021 for Wales, Northern Ireland, England and Scotland is provided in the [ONS dataset](#).

Percentage of people testing positive by region

Modelled estimates are provided for regions in Wales. Estimates are provided for the seven days up to 29 January 2022 based on modelling the entire seven-day period.

The rate of positive cases appears to be highest in the region covering Bridgend, Rhondda Cynon Taf and Merthyr Tydfil, though differences between the regions are small. The region covering Ceredigion, Pembrokeshire, Carmarthenshire, Powys has lower rates of positivity.

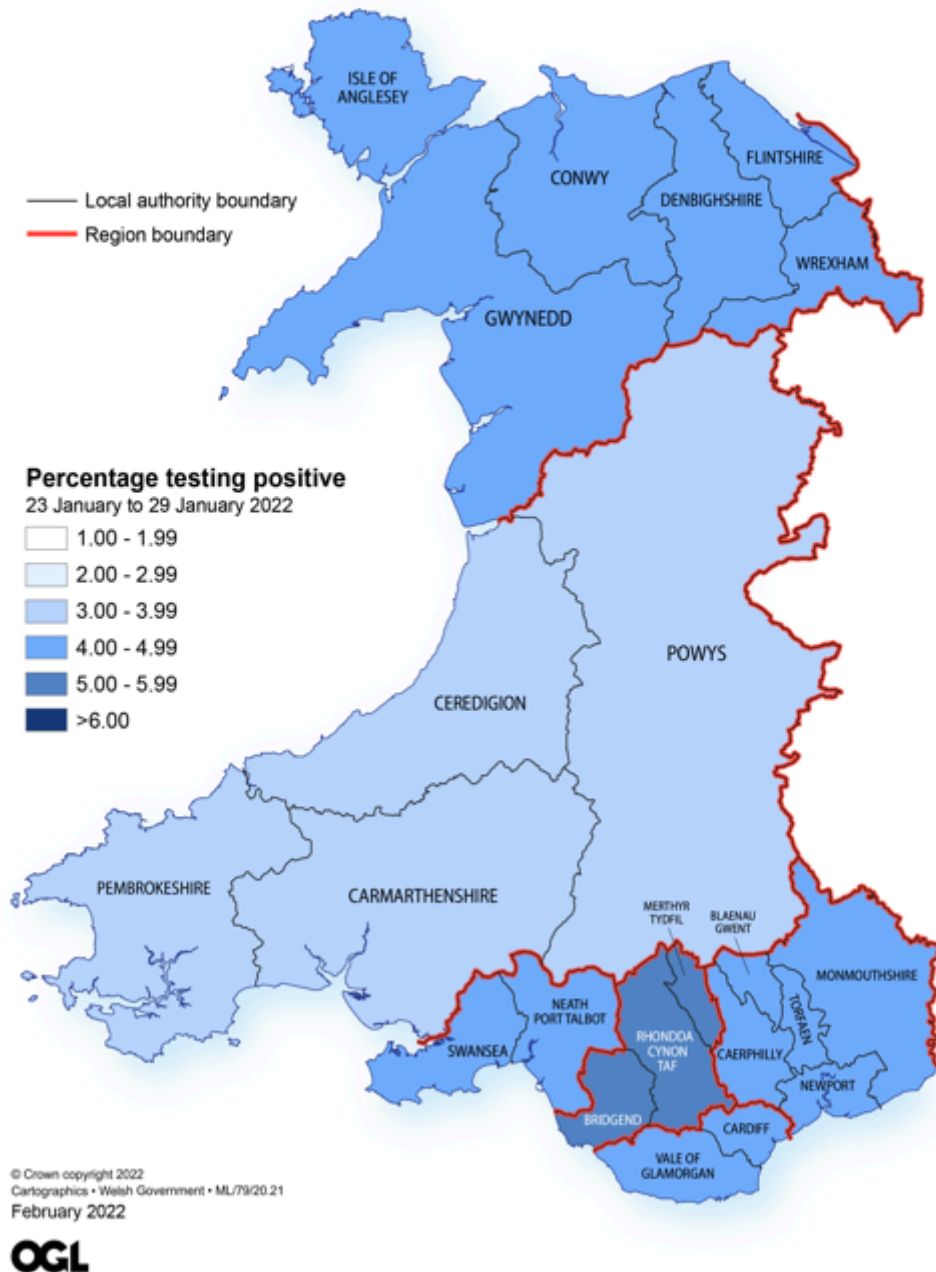

Please use caution when comparing regional estimates against the overall national estimate. The regional estimates are based on a different model and should not be compared with the national positivity estimate. Due to smaller sample sizes there is a higher degree of uncertainty in estimates for individual regions, as indicated by larger credible intervals.

Chart 2: Estimates of the percentage of the population in Wales testing positive for the coronavirus (COVID-19) by region 23 to 29 January 2022

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue bars give point estimates and the horizontal lines indicate the 95% credible intervals. Modelled estimates shown for regional estimates for the seven days up to 29 January 2022 based on modelling the entire seven-day period.

Estimates for incidence in Wales

Estimates of incidence of PCR-positive cases are produced for England, Wales, Northern Ireland and Scotland and are available in the [data tables on the ONS website](#).

The incidence of new infections (the number of new infections in a set period of time) helps us understand the rate at which infections are growing within the population and supports the main measure of positivity (how many people test positive at any given time) to provide a fuller understanding of the coronavirus

This document was downloaded from GOV.WALES and may not be the latest version.

(COVID-19) pandemic.

For more information on the method of estimating incidence please see the [methods article on the ONS website](#).

In Wales, in the week up to 15 January 2022, it is estimated that there were 21.98 new positive coronavirus (COVID-19) cases per 10,000 people per day (95% credible interval: 13.12 to 30.89).

This equates to 6,700 new positive cases in Wales per day (95% credible interval: 4,000 to 9,400).

The incidence rate has continued to decrease in the week up to 15 January 2022.

The incidence of new positive cases in Wales is coming down after reaching a peak in late December 2021, following a period of low incidence during the spring and early summer period. Credible intervals are wide due to the smaller sample size, however, and care should be taken in interpreting results.

When prevalence is very low it may not be possible to produce a reliable estimate.

Indicative estimates are provided going back to 28 October 2020.

Chart 3: Estimates of incidence rates per 10,000 people per day since 28 October 2020

Source: Coronavirus (COVID-19) Infection Survey, ONS

The point estimate and error bars are unpublished indicative estimates (light blue) and the published official estimates (dark blue). Estimates shown for surveillance weeks from 28 October 2020 to 15 January 2022.

Estimates for the countries of the UK

At the midpoint of the most recent week (23 to 29 January 2022), the estimated percentage of the community population with COVID-19 across the UK ranged from 3.52% in Scotland to 7.43% in Northern Ireland.

The numbers of people testing positive for COVID-19 have remained high in England and increased in the latest week in Wales and Northern Ireland. In

This document was downloaded from GOV.WALES and may not be the latest version.

Scotland, the percentage of people testing positive for COVID-19 decreased over two weeks, but the trend was uncertain in the most recent week.

There is some uncertainty around the individual point estimates for the nations. Estimates for the last few days of the series, shown as dashed lines in the chart below, have more uncertainty.

Chart 4: Estimates of the percentage of the population in the UK countries testing positive for the coronavirus (COVID-19) on nose and throat swabs since 19 December 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The lines represent the modelled trend based on the latest data. Estimates for the last few days of the series, shown as dashed lines in the chart, have more uncertainty.

The following tables summarise positivity rates and incidence rates across the UK countries.

Table 1: Positivity rates across UK countries for the week 23 to 29 January 2022

Country	Positivity rates (95% Credible Interval)		
Wales	4.57% (3.94 to 5.24)	1 in 20 people (1 in 25 to 1 in 20)	139,000 people (119,800 to 159,300)
England	4.83% (4.67 to 5.00)	1 in 20 people (1 in 20 to 1 in 20)	2,633,100 people (2,544,100 to 2,725,100)
Scotland	3.52% (3.08 to 4.00)	1 in 30 people (1 in 30 to 1 in 25)	185,100 people (162,100 to 210,800)
Northern Ireland	7.43% (6.44 to 8.46)	1 in 15 people (1 in 15 to 1 in 10)	136,300 people (118,200 to 155,200)

Source: Coronavirus (COVID-19) Infection Survey, Office for National Statistics

Table 2: Official estimates of incidence rates across UK countries, 2 to 15 January 2022

Country	Incidence (95% Credible Interval)	
Wales	21.98 cases per 10,000 people per day (13.12 to 30.89)	6,700 new cases per day (4,000 to 9,400)
England	37.31 cases per 10,000 people per day (34.42 to 40.21)	203,500 new cases per day (187,700 to 219,300)
Scotland	25.78 cases per 10,000 people per day (18.09 to 33.37)	13,600 new cases per day (9,500 to 17,600)

This document was downloaded from GOV.WALES and may not be the latest version.

Country	Incidence (95% Credible Interval)	
Northern Ireland	52.48 cases per 10,000 people per day (40.64 to 64.81)	9,600 new cases per day (7,500 to 11,900)

Source: Coronavirus (COVID-19) Infection Survey, Office for National Statistics

Definitions

Cases compatible with variants

Cases identified as being compatible with known variants of Covid-19 based on their genetic patterns. **Variants of Concern and Variants of Interest have recently been relabelled by the World Health Organisation (WHO). Further information on the identification of variants in the survey can be found on the ONS website.**

Community population

This survey covers people living in private households only and this is referred to as the community population. Residents in hospitals, care homes and/or other institutional settings are excluded.

Confidence intervals

A confidence interval gives an indication of the degree of uncertainty of an estimate, showing the precision of a sample estimate. The 95% confidence intervals are calculated so that if we repeated the study many times, 95% of the time the true unknown value would lie between the lower and upper confidence limits. A wider interval indicates more uncertainty in the estimate. Overlapping confidence intervals indicate that there may not be a true difference between two

This document was downloaded from GOV.WALES and may not be the latest version.

Get [information on copyright](#).

estimates.

Credible intervals

A credible interval gives an indication of the uncertainty of an estimate from data analysis. 95% credible intervals are calculated so that there is a 95% probability of the true value lying in the interval.

Incidence

The number of new infections over a period of time.

Modelled estimates

Estimates of positivity from this survey are based on statistical modelling of the underlying data. The model smooths the series to understand the trend and is revised each week to incorporate new test results.

Point estimates

The headline point estimates are based on the modelled trend and reflect the most representative reference point for the given week.

Positivity rate

The estimated proportion of people who test positive for coronavirus (COVID-19) at a point in time, with or without symptoms, based on nose and throat swabs.

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-23-29-january-2022-html> for the latest version.

Get [information on copyright](#).

Quality and methodology information

The results of the survey are based on self-administered nose and throat swabs provided by participants to the study. A subgroup of participants also provide blood test, taken by trained field staff.

As well as looking at overall **incidence**, **positivity** and antibody level, the survey will be used to examine the characteristics of those testing positive for COVID-19 and the extent to which those infected experience symptoms. The results are for private households only and do not apply to those in hospitals, care homes or other institutional settings. This is referred to as the **community population**.

The survey covers all the countries of the UK, enabling estimates to be calculated for each country individually, and in time the UK as a whole.

When comparing Test and Trace (T&T) and estimates from the COVID-19 Infection Survey it is important to note that T&T provides information on the number of tested people who are positive, while the estimates in this release are based on the total number of people who are currently infected at a particular point in time (prevalence). Estimates from this survey are also based on a random sample of the population, including people who are asymptomatic. Asymptomatic individuals are less likely to go for a test and therefore appear in the T&T data.

Fieldwork started first in England on 26 April 2020 meaning there is more cumulative data available for England enabling more detailed analysis at present. Fieldwork began in Wales on 29 June 2020 followed by Northern Ireland on 26 July 2020 and Scotland on 21 September 2020.

It is important to note that there is a significant degree of uncertainty with the estimates. This is because, despite a large sample of participants, the number of positive cases identified is small. Estimates are provided with 95% **credible** or **confidence** intervals to indicate the range within which we may be confident the true figure lies.

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-23-29-january-2022-html> for the latest version.

Get [information on copyright](#).

The **modelled estimates** are carried out afresh each week using the previous 6 weeks' data. The model works by smoothing the series to understand the trend and is revised each week to incorporate new test results. This means that the latest estimate for an earlier period may be different to the official estimate that was produced at the time. Chart 1 shows the latest modelled trend and the official **(point) estimates** that were published at the time.

ONS publishes **weekly statistical bulletins** and references tables and periodic **statistical articles** which include results for England, Wales, Northern Ireland and Scotland as they become available. The estimates for **Northern Ireland** and **Scotland** are published by the respective administrations, as we do here for Wales.

Further information about quality and methodology can be found on the **ONS website** and the survey pages on the **Oxford University site**.

Well-being of Future Generations Act (WFG)

The Well-being of Future Generations Act 2015 is about improving the social, economic, environmental and cultural wellbeing of Wales. The Act puts in place seven wellbeing goals for Wales. These are for a more equal, prosperous, resilient, healthier and globally responsible Wales, with cohesive communities and a vibrant culture and thriving Welsh language. Under section (10)(1) of the Act, the Welsh Ministers must (a) publish indicators (“national indicators”) that must be applied for the purpose of measuring progress towards the achievement of the wellbeing goals, and (b) lay a copy of the national indicators before Senedd Cymru. Under section 10(8) of the Well-being of Future Generations Act, where the Welsh Ministers revise the national indicators, they must as soon as reasonably practicable (a) publish the indicators as revised and (b) lay a copy of them before the Senedd. These national indicators were laid before the Senedd in 2021. The indicators laid on 14 December 2021 replace the set laid on 16 March 2016.

Information on the indicators, along with narratives for each of the wellbeing goals and associated technical information is available in the **Wellbeing of Wales report**.

This document was downloaded from GOV.WALES and may not be the latest version.
