Introduction

Antibody data for Wales is now published fortnightly in a separate release.

The Coronavirus (COVID-19) Infection Survey (CIS) is run across the whole of the UK and aims to estimate:

- how many people have the infection over a given time (positivity)
- how many new cases occur over a given period (incidence)
- how many people have antibodies to COVID-19

The survey helps track the extent of infection and transmission of COVID-19 among people in private residences, referred to as the **community population**.

Previous estimates can be found in the **Coronavirus (COVID-19) Infection Survey datasets (Office for National Statistics)**.

Proportion of people in Wales who had COVID-19

For the week 24 to 30 June 2022, it is estimated that 4.93% of the **community population** had COVID-19 (95% **credible interval**: 4.14% to 5.73%).

This equates to approximately 1 person in every 20 (95% credible interval: 1 in 25 to 1 in 17), or 149,700 people during this time (95% credible interval: 125,800 to 174,200).

The percentage of people testing positive for COVID-19 in Wales has increased in the most recent week.

Since the estimates are based on a relatively low number of positive tests, caution should be taken in over-interpreting any small movements in the latest

Chart 1: Official estimates of the percentage of the population in Wales testing positive for the coronavirus (COVID-19) on nose and throat swabs since 20 May 2022

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue line and shading represent the modelled trend and 95% credible intervals based on the latest data. The point estimate and error bars are the official estimates published at the time. Estimates for the last few days of the series, shown as dashed lines in the chart, have more uncertainty.

Infections compatible with the Omicron variant (and Omicron sub-variants) are the most common across all four UK countries. For cases compatible with the Omicron BA.2 variant the percentage of people testing positive has decreased in all countries of the UK apart from Wales where the trend is uncertain in the latest

week. Cases compatible with the Omicron BA.4 and BA.5 variants have increased in all countries of the UK in the most recent week. There are also some cases where the virus is too low for the variant to be identifiable and these are often due to individuals having had the virus for a longer period of time.

Chart 2: Estimates of the percentage of positive cases compatible with the Omicron variants since 20 May 2022

Source: Coronavirus (COVID-19) Infection Survey, ONS

The lines and shading represent the modelled trend and the 95% credible intervals based on the latest case data compatible with the Omicron sub-variants. There is more uncertainty for the final days estimates of the series, where a central estimate is not shown.

Percentage of people testing positive by region

Modelled estimates are provided for regions in Wales. Estimates are provided for the week up to 30 June 2022 based on modelling for the entire seven-day period.

The rate of positive cases appears to be highest in the region covering Vale of Glamorgan and Cardiff. The region covering Caerphilly, Blaenau Gwent, Torfaen, Monmouthshire and Newport has lower positivity rates, although differences between regions are small.

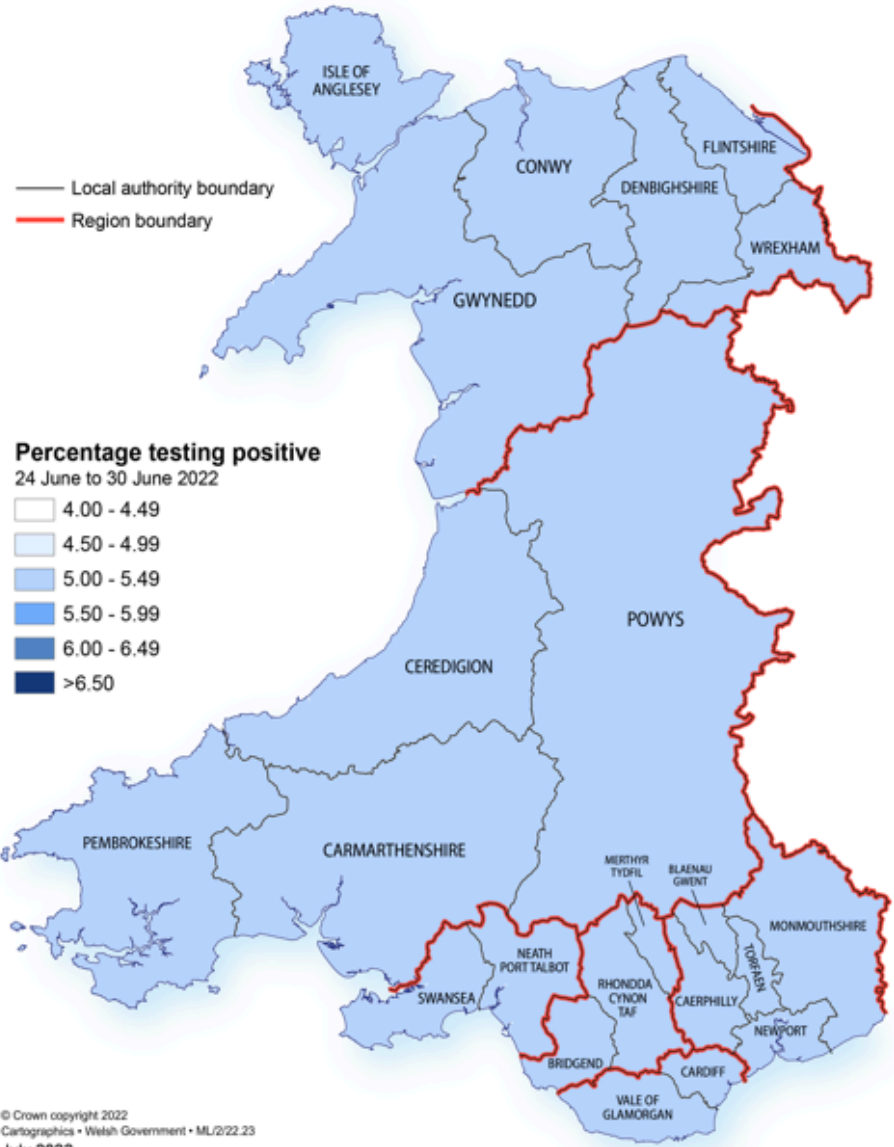

Please use caution when comparing regional estimates against the overall national estimate. The regional estimates are based on a different model and should not be compared with the national positivity estimate. Due to smaller sample sizes there is a higher degree of uncertainty in estimates for individual regions, as indicated by larger credible intervals.

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-24-30-june-2022.html> for the latest version.

Figure 1: Estimates of the percentage of the population in Wales testing positive for the coronavirus (COVID-19) by region between 24 to 30 June 2022

Source: Coronavirus (COVID-19) Infection Survey, ONS

Chart 3: Estimates of the percentage of the population in Wales testing positive for the coronavirus (COVID-19) by region 24 to 30 June 2022

Source: Coronavirus (COVID-19) Infection Survey, ONS
The blue bars give point estimates and the horizontal lines indicate the 95% credible intervals. Modelled estimates shown for regional estimates for the seven days up to 30 June 2022 based on modelling the entire seven-day period.

Estimates for incidence in Wales

Estimates of incidence of PCR-positive cases are produced for England, Wales, Northern Ireland and Scotland and all recent data are available in the [data tables on the ONS website](#).

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-24-30-june-2022.html> for the latest version.

The incidence of new infections (the number of new infections in a set period of time) helps us understand the rate at which infections are growing within the population and supports the main measure of positivity (how many people test positive at any given time) to provide a fuller understanding of the coronavirus (COVID-19) pandemic.

For more information on the method of estimating incidence please see the [methods article on the ONS website](#).

In Wales, during the week ending 15 June 2022, it is estimated that there were 38.32 new positive coronavirus (COVID-19) cases per 10,000 people per day (95% credible interval: 30.64 to 47.07).

This equates to 11,600 new positive cases in Wales per day (95% credible interval: 9,300 to 14,300). The incidence rate increased in the week up to 15 June 2022.

The incidence of new positive cases has been increasing since the mid-June in Wales. Previously, there was a lower peak in late December 2021 following a period of low incidence during the spring and early summer period. Credible intervals are wide due to the smaller sample size, however, and care should be taken in interpreting results.

When prevalence is very low it may not be possible to produce a reliable estimate.

Indicative estimates are provided going back to 28 October 2020.

Chart 4: Estimates of incidence rates per 10,000 people per day since 28 October 2020

Source: Coronavirus (COVID-19) Infection Survey, ONS

The point estimate and error bars are unpublished indicative estimates (light blue) and the published official estimates (dark blue). Estimates shown for surveillance weeks from 28 October 2020 to 12 June 2022

Estimates for the countries of the UK

At the midpoint of the most recent week (24 to 30 June 2022*), the estimated percentage of the community population with COVID-19 across the UK ranged from 3.95% in England to 5.94% in Scotland.

This document was downloaded from GOV.WALES and may not be the latest version.

The percentage of people testing positive has increased across all four nations of the UK in the most recent week.

There is some uncertainty around the individual point estimates for the nations. Estimates for the last few days of the series, shown as dashed lines in the chart below, have more uncertainty.

* Reference week for England and Northern Ireland is 23 to 29 June 2022

This document was downloaded from GOV.WALES and may not be the latest version.

Table 1: Positivity rates across UK countries for the week 24 to 30 June 2022

Country	Positivity rates (95% Credible Interval)		
Wales	4.93% (4.14 to 5.73)	1 in 20 people (1 in 25 to 1 in 17)	149,700 people (125,800 to 174,200)
England*	3.95% (3.78 to 4.12)	1 in 25 people (1 in 25 to 1 in 25)	2,154,000 people (2,062,000 to 2,247,100)
Scotland	5.94% (5.24 to 6.66)	1 in 17 people (1 in 19 to 1 in 15)	312,800 people (276,100 to 350,400)
Northern Ireland*	5.36% (4.52 to 6.27)	1 in 19 people (1 in 20 to 1 in 16)	98,400 people (82,900 to 115,100)

Source: Coronavirus (COVID-19) Infection Survey, Office for National Statistics

* Reference week for England and Northern Ireland is 23 to 29 June 2022

Table 2: Official estimates of incidence rates across UK countries, 6 to 12 June 2022

Country	Incidence (95% Credible Interval)	
Wales	38.32 cases per 10,000 people per day (30.64 to 47.07)	11,600 new cases per day (9,300 to 14,300)

This document was downloaded from GOV.WALES and may not be the latest version.

Get [information on copyright](#).

Country	Incidence (95% Credible Interval)	
England	40.10 cases per 10,000 people per day (37.93 to 42.32)	218,600 new cases per day (206,800 to 230,700)
Scotland	76.53 cases per 10,000 people per day (66.93 to 87.33)	40,300 new cases per day (35,200 to 46,000)
Northern Ireland	51.45 cases per 10,000 people per day (41.88 to 62.64)	9,400 new cases per day (7,700 to 11,500)

Source: Coronavirus (COVID-19) Infection Survey, ONS Office for National Statistics

Definitions

Cases compatible with variants

Cases identified as being compatible with known variants of Covid-19 based on their genetic patterns. **Variants of Concern and Variants of Interest have recently been relabelled by the World Health Organisation (WHO)**. Further information on the **identification of variants in the survey can be found on the ONS website**.

Community population

This survey covers people living in private households only and this is referred to as the community population. Residents in hospitals, care homes and/or other

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-24-30-june-2022.html> for the latest version.

Get [information on copyright](#).

institutional settings are excluded.

Confidence intervals

A confidence interval gives an indication of the degree of uncertainty of an estimate, showing the precision of a sample estimate. The 95% confidence intervals are calculated so that if we repeated the study many times, 95% of the time the true unknown value would lie between the lower and upper confidence limits. A wider interval indicates more uncertainty in the estimate. Overlapping confidence intervals indicate that there may not be a true difference between two estimates.

Credible intervals

A credible interval gives an indication of the uncertainty of an estimate from data analysis. 95% credible intervals are calculated so that there is a 95% probability of the true value lying in the interval.

Incidence

The number of new infections over a period of time.

Modelled estimates

Estimates of positivity from this survey are based on statistical modelling of the underlying data. The model smooths the series to understand the trend and is revised each week to incorporate new test results.

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-24-30-june-2022-html> for the latest version.

Get [information on copyright](#).

Point estimates

The headline point estimates are based on the modelled trend and reflect the most representative reference point for the given week.

Positivity rate

The estimated proportion of people who test positive for coronavirus (COVID-19) at a point in time, with or without symptoms, based on nose and throat swabs.

Quality and methodology information

The results of the survey are based on self-administered nose and throat swabs provided by participants to the study. A subgroup of participants also provide blood test, taken by trained field staff.

As well as looking at overall **incidence**, **positivity** and antibody level, the survey will be used to examine the characteristics of those testing positive for COVID-19 and the extent to which those infected experience symptoms. The results are for private households only and do not apply to those in hospitals, care homes or other institutional settings. This is referred to as the **community population**.

The survey covers all the countries of the UK, enabling estimates to be calculated for each country individually, and in time the UK as a whole.

When comparing Test and Trace (T&T) and estimates from the COVID-19 Infection Survey it is important to note that T&T provides information on the number of tested people who are positive, while the estimates in this release are

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-positivity-estimates-24-30-june-2022.html> for the latest version.

Get [information on copyright](#).

based on the total number of people who are currently infected at a particular point in time (prevalence). Estimates from this survey are also based on a random sample of the population, including people who are asymptomatic. Asymptomatic individuals are less likely to go for a test and therefore appear in the T&T data.

Fieldwork started first in England on 26 April 2020 meaning there is more cumulative data available for England enabling more detailed analysis at present. Fieldwork began in Wales on 29 June 2020 followed by Northern Ireland on 26 July 2020 and Scotland on 21 September 2020.

It is important to note that there is a significant degree of uncertainty with the estimates. This is because, despite a large sample of participants, the number of positive cases identified is small. Estimates are provided with 95% **credible** or **confidence** intervals to indicate the range within which we may be confident the true figure lies.

The **modelled estimates** are carried out afresh each week using the previous 6 weeks' data. The model works by smoothing the series to understand the trend and is revised each week to incorporate new test results. This means that the latest estimate for an earlier period may be different to the official estimate that was produced at the time. Chart 1 shows the latest modelled trend and the official **(point) estimates** that were published at the time.

ONS publishes **weekly statistical bulletins** and references tables and periodic **statistical articles** which include results for England, Wales, Northern Ireland and Scotland as they become available. The estimates for **Northern Ireland** and **Scotland** are published by the respective administrations, as we do here for Wales.

Further information about quality and methodology can be found on the **ONS website** and the survey pages on the **Oxford University site**.

Well-being of Future Generations Act (WFG)

The Well-being of Future Generations Act 2015 is about improving the social, economic, environmental and cultural wellbeing of Wales. The Act puts in place seven wellbeing goals for Wales. These are for a more equal, prosperous, resilient, healthier and globally responsible Wales, with cohesive communities and a vibrant culture and thriving Welsh language. Under section (10)(1) of the Act, the Welsh Ministers must (a) publish indicators (“national indicators”) that must be applied for the purpose of measuring progress towards the achievement of the wellbeing goals, and (b) lay a copy of the national indicators before Senedd Cymru. Under section 10(8) of the Well-being of Future Generations Act, where the Welsh Ministers revise the national indicators, they must as soon as reasonably practicable (a) publish the indicators as revised and (b) lay a copy of them before the Senedd. These national indicators were laid before the Senedd in 2021. The indicators laid on 14 December 2021 replace the set laid on 16 March 2016.

Information on the indicators, along with narratives for each of the wellbeing goals and associated technical information is available in the [Wellbeing of Wales report](#).

Further information on the [Well-being of Future Generations \(Wales\) Act 2015](#).

The statistics included in this release could also provide supporting narrative to the national indicators and be used by public services boards in relation to their local wellbeing assessments and local wellbeing plans.
