Welsh National Database for Substance Misuse in Wales 2019-20

1 Introduction

1.1 This report has been compiled by Digital Health & Care Wales (DHCW) in collaboration with the Welsh Government and Public Health Wales, and contains statistics from the Welsh National Database for Substance Misuse (WNDSM) for the period 1st April 2019 to 31st March 2020.

1.2 The report should be read in conjunction with the document entitled 'The Annual Profile of Substance Misuse in Wales 2019-20'. This document will provide additional substance misuse related information currently available from routinely published sources in Wales to support and add to the information gained through the WNDSM.

2 Background

2.1 The overall management of the system, including advice on enhancements to the database, national performance issues linked to the data and the analysis of other routinely collected data is overseen by the Welsh Government Data Information and Analysis Board (DIAB).

2.2 All substance misuse treatment service providers in Wales, in receipt of Welsh Government funding via the Area Planning Boards (APBs), are required to comply with the reporting requirements of the database. Comprehensive guidance which includes the common dataset and definitional guidance was first issued on 1st March 2006 and has been revised regularly.

2.3 Information from the database is the official source of validated data for treatment service providers and APBs to monitor and report performance against the national Key Performance Indicators (KPI) in respect to waiting times and engagement rates. These KPIs have been in existence since 2006, but were refreshed in November 2017 for immediate implementation.

2.4 In April 2009 the Welsh Government adopted the Treatment Outcome Profile (TOP) tool. Further information on the tool can be found in [Annex A](#).

2.5 In 2013-14 a review of the current dataset comprising the WNDSM was undertaken. The purpose of the review and redevelopment of a Substance Misuse Data Set was to ensure that the data submitted to the national database was an accurate reflection of the delivery of Substance Misuse Services. One of the significant requirements of the new Substance Misuse Data Set was to capture multiple events which occur during a Client Journey, this includes a Referral, an Assessment, multiple Treatment Modalities, multiple Treatment Outcome Profiles (TOPS) and a Discharge to enable better analysis of the data in the future.

3 Data Quality

3.1 The Welsh Government's Substance Misuse Advisory Regional Team (SMARTs) have worked with APBs and treatment service providers to improve data quality. However, care needs to be exercised when looking at trends as a number of treatment service providers had not submitted all data for the relevant fields by the freeze date of 21st August 2020. As a result of the suspension of the submissions of data, the freeze of the data was postponed until this date to ensure that service providers had sufficient time to submit their data. The submission of data was suspended by the Welsh Government from 9th April 2020 until 24th June 2020, this resulted in a delay in receiving the March 2020 data until June 2020.

3.2 The data quality issues that affect this report are listed below:

- Some of the demographic data will be inaccurate because some clients are reluctant or unable to provide accurate responses to questions. This will always be the case with a system that relies largely upon self-reporting.
- Some treatment service providers are failing to close cases when a client is transferred between treatment service providers. This means that some individuals will be counted more than once on the database. However, some clients may legitimately be receiving treatment from more than one treatment service provider.
- Clients are categorised by 'main problematic substance' which means that many clients categorised under 'alcohol' may also be receiving treatment for drug misuse and vice versa.
- The main problematic substance was not recorded for some clients, including 5,911 referrals where no assessment date had been recorded as at the database freeze date of 21st August 2020. This is higher than earlier years because in 2014-15, for the first time, the problematic substance data field was based around the assessment event as opposed to the referral event. Therefore, even if a primary substance was entered locally by the treatment service provider at the time of referral, the information would not have been reported to the national database until the time of their assessment. In [Section 6](#), these 5,911 referrals are broken down by age/sex, ethnicity, APBs and source of referral for information purposes, but for the subsequent analysis of referrals in that section, for which primary substance is a key element, these referrals have been excluded.

3.3 The number of treatment service providers submitting to the database has been declining during the last 5 years because of a number of treatment service providers merging. Whilst there has been a reduction in the number of treatment service providers submitting data, 54 treatment service providers submitted in 2015-16, 55 in 2016-17, 44 in 2017-18, 42 in 2018-19 and 43 in 2019-20, this has not resulted in a reduction in the reported data.

- There was widespread under-reporting of secondary problem substance; this inhibits the identification of emerging trends and patterns in poly-drug use.

3.4 The database is dynamic i.e. records are subject to amendment as further information is submitted by treatment service providers. This means that figures in this report are not directly comparable with those published in earlier reports.

3.5 A summary of key factors relating to this report can be found in [Annex A](#).

4 Results Summary

4.1 Area Comparison

Direct comparison between Area Planning Board (APB) for referral, assessment, treatment and closure activity can be found in [Section 5](#).

4.2 Referrals

The following provides a summary of all activity within 2019-20. Therefore, this summary captures all referral activity within the year and any assessment, treatment or closure information which has occurred in year by relating to pre 1st April 2019 referrals.

- There were 23,887 referrals to the database in 2019-20, and a further 2,186 referrals who did not attend (DNA) prior to assessment.
- This represented a slight decrease in referrals compared to last year, with a decrease of 4.3% on 2018-19 (24,971). See [Chart 4.1](#) for a time series.
- Some clients were referred more than once during 2019-20 with the 23,887 referrals relating to 17,026 individuals, of whom 10,135 were new to the database.
- In 2019-20, a large number of referrals (5,911) did not have an associated main problematic substance on account of there not having been an assessment (see “Referral exclusions for primary substance analysis” for further details), and therefore for subsequent breakdown of referrals by main substance, these referrals are excluded.
- Of the 22,887 referrals, 5,911 did not have an associated main problematic substance. Of the remaining 17,976 referrals:
 - 51.1% of these referrals were described as having alcohol as the main problematic substance and 48.4% had drugs as the main problematic substance; in 0.4% of cases had an assessment date but the main problematic substance was not recorded.
 - Males accounted for 62.4% of alcohol referrals and 71.7% of drug referrals.
 - Median age for alcohol referrals was 43, whilst median age for drugs was 33.
 - 15.2% of alcohol referrals (where age was reported) were for clients aged under 30 – the comparable figure for drug referrals was 36.7%.
- Heroin referrals accounted for 18.5% (3,304), Cannabis referrals accounted for 10.7% (1,914) and Cocaine accounted for 6.9% (1,233) of all referrals, an increase from 3.0% (555) in 2015-16.
- Detailed results for Referrals are shown in [Section 6](#).

4.3 Assessments

- The total number of clients assessed in 2019-20 was 18,184 a slight decrease of 3.2% from 2018-19 (18,770). See [Chart 4.1](#) for Time Series.
- In 2019-20 the number of drug clients assessed was 8,787 compared with 9,310 alcohol clients.
- Males accounted for 62.6% of alcohol assessments and 71.8% of drug assessments.
- Heroin assessments accounted for 18.2% (3,312), Cannabis assessments accounted for 10.8% (1,964) and Cocaine accounted for 6.9% (1,246) of all assessments, where the main problematic substance is known.

- Detailed results for Assessments are shown in [Section 7](#).

4.4 Treatments

- The total number of clients starting treatment in 2019-20 was 15,796, down by 3.8% on 2018-19 (16,397). See [Chart 4.1](#) for Time Series.
- In 2019-20 the number of drug clients starting treatment was 7,825 compared with 7,838 alcohol Clients.
- Detailed results for Treatments are shown in [Section 8](#).

4.5 Waiting Times

- Of the 15,778 clients who started treatment (and had valid waiting times), the percentage that started within 20 working days was 91.5% in 2019-20, a slight increase from 2018-19 (91.3%), and includes alcohol, drug and not reported main problematic substance. Please note that comparisons cannot be made with figures reported in earlier reports. See paragraph 3.5 of the [data quality](#) section for further details.
- 90.9% (7,119) of clients with alcohol as the main problematic substance were treated within 20 working days, whilst 92.1% (7,202) of clients with drugs as the main problematic substance were treated within 20 working days. This was an increase in the percentage of clients treated from 90.3% (7,494) for alcohol and 91.6% (7,371) for drugs in 2018-19.
- Detailed results for Waiting Times are shown in [Section 9](#).

4.6 Treatment Outcome Profiles

- Table 10.1a-10.1f show the overall reductions in the frequency of alcohol and drug consumption between a starting TOP and an exit TOP.
- Table 10.1g-10.1i show the overall change in physical health, psychological health and quality of life between a starting TOP and an exit TOP.
- Detailed results for Treatment Outcome Profiles are shown in [Section 10](#).

4.7 Reasons for Closure

- The percentage of cases ending with a planned closure has increased from 47.8% in 2015-16 to 53.9% in 2019-20.
- Detailed results for Case Closures are shown in [Section 11](#).

4.8 Key Performance Indicators

- Table 12.1 to 12.5 show the Five Key Performance Indicators for the APBs.
- The percentage of cases ending in a DNA post assessment showed a decrease each year from 17.4% in 2015-16 to 11.0% in 2019-20.
- The percentage of clients starting treatment within 20 working days has increased from 83.5% in 2015-16 to 91.5% in 2019-20.

- The percentage of cases reporting a reduction, no change or abstinence in problematic substance misuse was higher in 2019-20 compared with the previous 4 years.
- The percentage of cases closed with a positive treatment closure has been increasing year on year, with 82.5% in 2019-20 compared with 71.2% in 2015-16.
- This year has seen the introduction of the blood borne virus KPI, which reports on the number and percentage of clients who are tested for BBV.
- Detailed results for Key Performance Indicators are shown in [Section 12](#).

Total	23,887	18,184	15,796	25,140

Source: WNDSM, NHS Wales Informatics Service

- (a) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.
- (b) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB.

Table 5.2 shows the number of records that would have been open as at 31st March of each year i.e. had no closure date or the closure date was after the 31st March, by APB and main problematic substance of alcohol or drugs.

Table 5.2: Open records by area of residence time series

(a) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.

(b) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

Table 5.3a shows the history of referrals in 2019-20. Of the 23,887 referrals in 2019-20, these related to 17,026 individuals. 10,135 (59.5%) of the individuals referred in 2019-20 were new cases, meaning that they were referred to a treatment service provider for the first time. The percentage of new cases varied across APB areas, ranging from 49.3% in Western Bay to 68.8% in Powys. A similar range is seen in table 5.3b for alcohol and 5.3c for drugs, with Western Bay reporting the lowest percentage of new cases and Powys reporting the highest across the APB areas.

Table 5.3a: Previous history of referrals by APB in 2019-20: All Substances

	All Referrals	Individuals referred in 2019-20	Average referrals per individual	New Cases	Percentage of New Cases

6 Referrals

The total number of referrals in 2019-20 was 26,073.

Figure 6.1 shows the status along the treatment pathway for the 26,073 referrals in 2019-20. **Of these, 2186 had a DNA prior to assessment (shown along the red branch of the diagram) and for all further analysis of referrals, these have been excluded.**

Of the remaining 23,887 referrals (excluding the DNAs before assessment) in 2019-20, 20,913 (87.5%) had already been closed by the 21st August 2020 freeze date, and of those, 15,168 (63.5%) had commenced any form of treatment before being discharged.

Of the 26,073 referrals in 2019-20, 5,330 were closed to services before an assessment took place. The majority of these records were closed as a result of a third party referral being received but when the client was contacted, they were unaware that a referral was made, or following an initial assessment, the client had chosen not to commence a recommended treatment intervention, or they were not ready to engage in treatment or there was no substance misuse treatment needed.

There were 2,147 referrals where the client was closed to services before a treatment had commenced. Of these, 212 had dropped out of contact and were closed as DNA, whilst the remaining 1,935 were closed for a number of different reasons e.g. treatment withdrawn, moved, deceased etc.

Note that the numbers in figure 6.1 only relate to activity associated with 2019-20 referrals and therefore they exclude activity relating to pre-1st April 2019 referrals.

Figure 6.1: Current status along treatment pathway for those referred in 2019-20 (as at 21st August 2020 freeze date)

Sources of Referral

Table 6.5 and chart 6.2 show the number of referrals by each of the referral source groups, by main problematic substance category (alcohol or drugs). Self referrals accounted for 40.9% of the referrals (50.5% for all alcohol referrals and 39.6% for all drug referrals), and the Criminal Justice System accounted for 16.9% of referrals (8.5% for all alcohol referrals and 29.0% for drug referrals).

Table 6.5: Source of referrals in 2019-20 by main problematic substance: All Referrals

Individuals referred in 2019-20

Table 6.6 shows that the 23,887 referrals made in 2019-20 (excluding those clients that DNA before assessment) related to 17,026 individual clients with an average of 1.4 referrals per client during the financial year. Of these, 17,026 clients, 10,135 (59.5%) were new cases, meaning that they were referred to a treatment service provider for the first time in 2019-20, or at least for the first time since the database began on the 1st April 2005.

Table 6.6: Previous history of referrals in 2019-20: All Referrals

(a) Number of individuals who had not been previously referred since April 2005 (commencement of the database)

(b) Percentage of all referrals by age category

(c) Includes 23 new cases in 2015-16, 12 in 2016-17, 5 in 2017-18, 21 in 2018-19 and 35 in 2019-20 where the age is less than 10.

Referral exclusions for main problematic substance analysis

As explained in the data quality section ([Section 3](#)), there were 5,911 referrals for which the main problematic substance was unknown due to there being no assessment date recorded for that client as at the freeze date of 21st August 2020. For information, the breakdown of these excluded referrals (by gender, age, ethnicity, APBs and source of referral) is shown in Table 6.8. To provide a comparison, the profile of these excluded cases is shown alongside the included referrals, and it can be seen that there appears to be no disproportionate exclusion of referrals on account of age or gender. For ethnicity, the main difference between the excluded and included cases is around the category of “Not Stated”, which is much more prevalent in the excluded cases.

In relation to the APBs, there were high numbers of exclusions (relatively) for North Wales, although comparatively few for Powys. For source of referral, there were more exclusions (relatively) where the referrals were from Self and NHS and fewer exclusions for statutory drug service and non-statutory drug service.

It should be noted however that we would expect that the vast majority of these unknown main problematic substances would be populated subsequently, following an assessment.

Table 6.8: Referrals excluded for main problematic substance

Gender	Excluded	Included
Male	3,810 (64.5%)	15,836 (66.3%)

Referrals by main problematic substance

Table 6.9 shows that of the 23,887 referrals in 2019-20 (excluding DNAs before assessment), alcohol was the main problematic substance reported in 9,191 of the cases, of which 1,820 referrals were for alcohol in combination with drugs. There were 8,709 referrals with drugs as the main problematic substance reported, of which 1,173 were in combination with alcohol. For 76 of the referrals (0.4%), no valid main problematic substance was reported at time of referral. For the remaining 5,911 these are clients who have not reached the assessment stage, the main problematic substance should be completed once the assessment has taken place.

Table 6.9: Referrals in 2019-20 by main problematic substance

		Total			
Main problematic substance		Male	Female	Number	Per Cent
Alcohol	Alcohol alone (a)	4,434	2,937	7,371	41.0

- (e) No problematic substance reported to the database at stage of referral, the vast majority of these unknowns will be populated following assessment of the client.
- (f) No problematic substance reported to the database as the client has not reached the assessment stage.

Table 6.10 shows the breakdown of main problematic substances in more detail. Heroin is the most frequently reported drug accounting for 3,304 (18.5%) of referrals, followed by Cannabis with 1,914 (10.7%).

The list of drugs included under the groups “Other Opiates”, “Other Drugs” and “Other Stimulant” are shown in [Annex C](#).

Males accounted for 67.0% of all referrals, where the main problematic substance is known, although patterns vary according to substance, with males accounting for 62.5% of referrals with alcohol as the main problematic substances, 71.7% for drugs, and as high as 100.0% for Performance and Image Enhancing Drugs and 84.1% for Cocaine.

The median age of clients referred in 2019-20 where alcohol was the main problematic substance was 43, compared with 33 for clients referred where the main problematic substance was drugs.

Table 6.10: Referrals in 2019-20 by main problematic substance (where known)

7 Assessments

Figure 7.1 shows the status along the treatment pathway of all clients assessed in 2019-20.

Of the 18,184 clients assessed, 13,704 cases had already been closed by the 21st August 2020 freeze date, 2,195 (11.7%) of which had been closed without commencement of any form of treatment.

Note that the numbers in figure 7.1 only relate to activity associated with those clients who were assessed in 2019-20, as compared with figure 6.1 which was based on clients referred in 2019-20. As a comparison, the number of assessments shown in figure 6.1 (17,627) related to clients who were both referred in 2019-20 **and** assessed on or before 31st March 2020, whereas the 18,184 figure below indicates all clients assessed in 2019-20, including those whose referral date was prior to 1st April 2019. Similarly, figures relating to “treatments started” and “case closures”, which appear later on in this report, are not comparable with the figures shown below (15,630 and 11,497 respectively).

Figure 7.1: Current status along treatment pathway for those assessed in 2019-20 (as at 21st August 2020 freeze date)

Assessments by source of referral

Table 7.5 shows the number of assessments by each of the referral source groups by main problematic substance category (alcohol or drugs). Self-referrals accounted for 45.0% of the referrals (50.3% of all alcohol referrals and 39.6% of all drug referrals) and the Criminal Justice System accounted for 18.4% of referrals (8.5% of all alcohol referrals and 29.0% of all drug referrals).

Table 7.5: Assessments by source of referral in 2019-20 by main problematic substance

Referral Source (a)	Alcohol	Drugs	Not Reported	Total

Assessments by main problematic substance

Table 7.6a-b shows the breakdown of main problematic substances in more details, Heroin is the most frequently reported drug accounting for 3,312 (18.2%) of all assessments, followed by Cannabis with 1,964 (10.8%).

The list of drugs included under the groups “Other Opiates”, “Other Drugs” and “Other Stimulant” are shown in [Annex C](#).

The age and gender breakdown of clients assessed to the database by each of the main problematic substance groups are shown in Table 7.7a to 7.7f.

Males account for 67.0% of all assessments and 67.0% of all assessments where the main problematic substance is known. Patterns vary according to substance, with males accounting for 62.6% of assessments with alcohol as the main problematic substance, 71.1% for drugs, 84.2% for Cocaine, and as high as 100% for Performance and Image Enhancing Drugs.

The median age of clients assessed in 2019-20 was 25 for Cannabis, 29 for Cocaine, and 38 for Heroin.

Table 7.6a: Assessments in 2019-20 by main problematic substance

Main problematic substance	Male	Female	Number	Total Per Cent (a)

Table 7.8 shows the number of assessments where the client has reported that they are currently receiving or have been assessed as needing care from Mental Health Services. The percentage of clients reporting that they are currently receiving or have been assessed as needing care from Mental Health Services has been increasing over the last 5 years from 40.1% in 2015-16 to 48.1% in 2019-20.

(a) Percentage of all assessments reported by Area Planning Board

(b) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.

(c) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

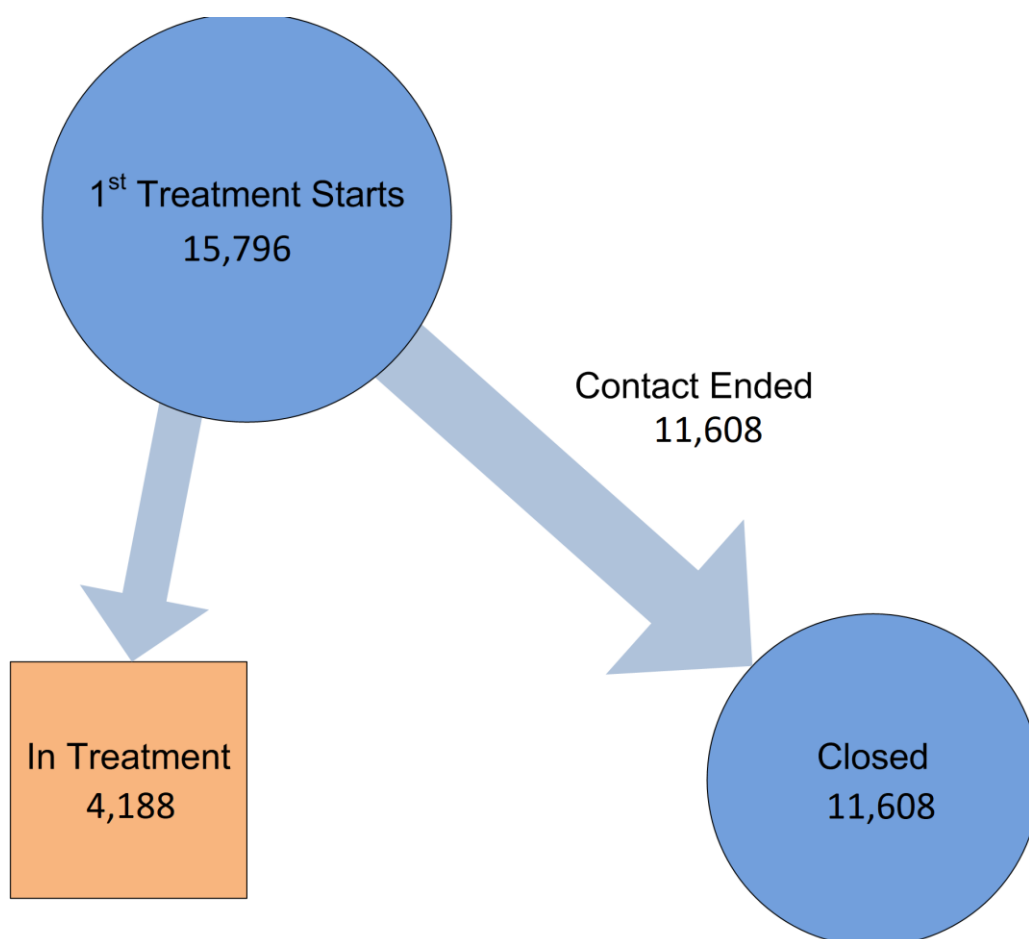

8 Treatments

Figure 8.1 shows the status of those clients who started treatment in 2019-20.

Of the 15,796 clients who started treatment, 11,608 (73.4%) had already been closed by the 21st August 2020 freeze date.

Note that the numbers in figure 8.1 only relate to clients who started treatment in 2019-20, as compared to figures 6.1 and 7.1, which are based on referrals and assessments in 2019-20 respectively, and therefore the figures of 15,796 (for treatment starts) and 11,608 (for closed cases) below are not comparable with the treatment start and closed cases figures shown in the previous diagrams. It should also be noted that whereas these figures are based on the date of first treatment only, [table 8.5](#) goes on to report on any treatments, regardless as to whether they are the first treatment or not.

Figure 8.1: Current status along with treatment pathway for those treated in 2019-20 (as at 21st August 2020 freeze date)

Clients commencing treatment by Age, Gender and Ethnic Origin

Table 8.6 reports on individual treatment modalities which started in 2019-20, and these figures are higher than those shown in previous tables in [Section 7](#), with the previous figures being based on the first treatment modality and not subsequent treatment modalities, which may also have started in 2019-20. The treatment pathway usually involves the client receiving a combination of both structured and less-structured interventions. In fact, only 36.5% of clients started one treatment modality within the year, with 19.7% starting two treatment modalities and 43.8% starting three or more modalities.

Table 8.6: Individual treatment modalities by main problematic substance in 2019-20

Treatment Modality (a)	Main Problematic Substance			
	Alcohol	Drugs	Not Reported	Total
Structured Interventions				
Substitute Opioid Prescribing (Methadone) and related Psychosocial Interventions	16	1,212	12	1,240
Inpatient Treatments	580	219	10	809
Substitute Opioid Prescribing (Buprenorphine) and related Psychosocial Interventions	22	659	6	687
Structured Day Programmes	156	94	21	271
Community Detoxification	121	43	3	167

(a) A Client may be receiving more than one treatment. See [Annex C](#) for more information on treatment modalities.

9 Waiting Times

Table 9.1a shows the times from referral to treatment for clients by treatment year. The figures only relate to those who have already started treatment, and thus exclude those still waiting to commence treatment. In 2019-20, 91.5% of treatments started within the target 20 working days of referral. As the database is dynamic, this figure is not comparable with figures published in earlier reports. See paragraph 3.5 of the [data quality](#) section for more information.

Table 9.1a: Time between referral and treatment: all main problematic substances (a)

10 Treatment Outcome Profile (TOPs)

Guide to TOPs and the analysis used in Tables 10.1a-10.1i

Treatment Outcome Profile (TOPs) were introduced for clients referred from the 1st April 2009, and therefore the TOPs analysis tables relate to referrals on or after this date only. These analyses only refer to those clients who have started their treatment and therefore might not be representative of all clients.

The TOP provides a systematic method of measuring both qualitative and quantitative progress at an individual level to gauge the impact of substance misuse treatment. It measures an individual's health and well-being against four key domains that have been established internationally as the areas most affected by substance misusing behaviour,

- Drug and Alcohol Use;
- Physical and Psychological Health;
- Offending and Criminal Involvement; and,
- Social Functioning.

An individual is assessed against these four domains at the beginning of treatment (joint assessments by the client and the key worker) as part of routine care planning, every 3 months as part of the review to measure progress and a final exit TOP in undertaken on completion of treatment.

Treatment service providers indicate on the TOP form as to whether that TOP is a starting, review or exit TOP and comparisons are made between the various measure recorded on the start TOP and exit TOP. However, within the WNDMS, there are instances of referral which have had more than one associated start TOP or more than one exit TOP. For the purposes of analysis, where a referral has had more than one recorded starting TOP, the one with the earliest interview data has been selected for the purposes of comparison, and where a referral has had more than one exit TOP recorded, the one with the latest interview date has been selected.

With regards to the changes in frequency of substances (shown in tables 10.1a-10.1f), these are based on the number of days out of the previous 28 that a client had used the substance in question. For example, in the case of tables 10.1a and 10.1b, it is the frequency of alcohol consumption that recorded, split by those whose main problematic substance group is alcohol (Table 10.1a), and for those whose main problematic substance group is drugs (Table 10.1b). For the former group, clients consumed alcohol for an average of 20.8 days out of the previous 28 at the time of the start TOP, and an average of 11.0 days out of the previous 28 days by the time of the exit TOP.

Note that for a particular referral, a comparison is only made between starting and exit TOP where the client's starting TOP frequency is greater than zero **and** their exit TOP is greater or equal to zero.

The "Percentage Change" shown (-46.9% in Table 10.1a) represents the percentage change in the average frequency of days of use between starting and exit TOPs. The "Percentage Not Using" figure (35.5% in Table 10.1a) is the percentage of referrals where the frequency of use was zero at the time of the exit TOP, having been more than zero at the time of the starting TOP.

For the measurement of changes in physical health, psychological health and quality of life (Table 10.1g-10.1i), a system of scoring is used based on a 0 to 20 scale, 0 being worst and 20 best.

For both frequency of use and score measures, referrals in which either the start or the exit TOP values are blank have been excluded from these analyses.

Results

Table 10.1a shows the average change in frequency in the use of alcohol between start and exit TOPs, for those with a main problematic substance of alcohol. For those clients with alcohol as their main problematic substance, the average number of days of alcohol use fell from 20.8 to 11. (-46.9%), and 35.5% had not used alcohol at all in the 28 days prior to the exit TOP.

Table 10.1a: Changes in Frequency of use of Alcohol (a) between start TOP and exit TOP: April 2009 to March 2020

		Number of comparisons	Frequency at starting TOP (days)	Frequency at exit TOP (days)	Percentage Change	Percentage not using

- (a) For those clients reporting alcohol use in the 28 days before the start TOP
- (b) Excludes invalid or blank gender
- (c) The average number of days a substance is used at start TOP. If a referral has multiple start TOPs then the earliest start TOP is used.
- (d) The average number of days a substance is used at exit TOP. If a referral has multiple exit TOPs then the latest exit TOP is used.
- (e) The relative change between the start TOP and the exit TOP.
- (f) No alcohol use recorded in the 28 days before the exit TOP.

Table 10.1b shows the average change in frequency in the use of alcohol between start and exit TOPs, for those with a main problematic substance of drugs. For those with drugs as their main problematic substance, the frequency of alcohol used fell from 14.7 to 8.2 (-44.6%), with 42.7% not having used alcohol at all in the 28 days prior to the exit TOP.

Table 10.1b: Changes in Frequency of use of Alcohol (a) between start TOP and exit TOP: April 2009 to March 2020

		Number of comparisons	Frequency at starting TOP (days)	Frequency at exit TOP (days)	Percentage Change	Percentage not using

(a) For those clients reporting opiate use in the 28 days before the start TOP

(b) Excludes invalid or blank gender

(c) The average number of days a substance is used at start TOP. If a referral has multiple start TOPs then the earliest start TOP is used.

(d) The average number of days a substance is used at exit TOP. If a referral has multiple exit TOPs then the latest exit TOP is used.

(e) The relative change between the start TOP and the exit TOP.

(f) No opiate use recorded in the 28 days before the exit TOP.

Table 10.1d shows the average change in frequency in the use of Cannabis between start and exit TOPs, for those with a main problematic substance of Cannabis. The frequency of Cannabis use fell from 22.3 to 11.6 (-48.0%), with 40.3% not having used Cannabis at all in the 28 days prior to the exit TOP.

Table 10.1d: Changes in Frequency of use of Cannabis (a) between start TOP and exit TOP: April 2009 to March 2020

Table 10.1g shows the average change in Physical Health between start and exit TOP by main problematic substance category, gender, age and treatment modality. Overall, the average Physical Health score increased from 11.3 to 13.0 (15.5%). The treatment modality for the vast majority of clients was “Psychosocial Interventions”, although clients will usually receive more than one treatment intervention during the treatment pathway.

Table 10.1g: Changes in Physical Health between start TOP and exit TOP: April 2009 to March 2020

11 Case Closures

Table 11.1a shows the number of case closures by the year of closure and also by closure reason. Although excluded from the referrals analysis in [Section 6](#), the cases closed with DNA prior to assessment are shown in this table. Of the 25,403 cases closed in 2019-20, 52.1% were closed for planned reasons; this has been increasing from 47.6% in 2015-16. The DNA rate has been declining from 28.5% in 2015-16 to 17.2% in 2019-20.

Table 11.1a: Reason for closure by main problematic substance: All Substances

(a) Client has been contacted following a third party referral and states that they are not ready to engage in treatment or when assessed there is no substance misuse treatment need for the client.

(b) Client declined treatment includes clients that declined the assessment.

(c) The treatment service provider has withdrawn treatment provision from the client usually as a result of a breach of contract.

Table 11.1b and 11.1c show closures for cases with a main substance of alcohol and drugs respectively.

For alcohol (Table 11.1b), 77.2% of closures were planned and the overall DNA rate was 10.3%.

For drugs (Table 11.1c), planned closures have been increasing each year, accounting for 68.4% of all closures in 2019-20, compared with 57.0% in 2015-16, whilst DNAs have been gradually reducing from 17.3% in 2015-16 to 11.7% in 2019-20.

Source: WNDMS, NHS Wales Informatics Service

(a) Client has been contacted following a third party referral and states that they are not ready to engage in treatment or when assessed there is no substance misuse treatment need for the client.

(b) Client declined treatment includes clients that declined the assessment.

(c) The treatment service provider has withdrawn treatment provision from the client usually as a result of a breach of contract.

12 Performance Summary

Tables 12.1 to 12.5 report on the five key performance indicators (KPI) which report performance across the Area Planning Boards (APBs), based on the client's area of residence. See [Annex C](#) for background information on the KPIs. Due to the dynamic nature of the database, the figures reported in this section will change over time, as further information may be submitted by treatment service providers.

Table 12.1 reports on clients that Did Not Attend (DNA) or do not respond to follow up contact post the assessment stage.

Table 12.1: KPI 1 - DNA Post Assessment: by APB

DNA Post Assessment	Discharge Year									
	2015-16		2016-17		2017-18		2018-19		2019-20

Source: WNDSM, NHS Wales Informatics Service

(a) Percentage of all closures with an assessment date

(b) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.

(c) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

Table 12.2 reports on KPI 2 which measures the waiting times for the service between referral and treatment. The target is for treatment service providers to achieve a waiting time of less than 20 working days between referral and treatment.

Table 12.2: KPI 2 – Referral to Treatment Waiting Times: by APB

< 20 working days (a)	Treatment Year									
	2015-16		2016-17		2017-18		2018-19		2019-20	
	Number	Per Cent (b)	Number	Per Cent (b)	Number	Per Cent (b)	Number	Per Cent (b)	Number	Per Cent (b)

(a) Bank holidays are included in the waiting times.

(b) Percentage of all clients treated.

(c) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.

(d) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

Table 12.3 reports on KPI 3 which measures whether the substance misuse is reduced, abstinent or unchanged for any of the problematic substances listed on the TOP form. The substance misuse is reduced or unchanged if the number of days a substance has been used within the 28 days prior to the start TOP is higher than or the same as the equivalent number of days a substance has been used within the 28 days prior to the most recent review or exit TOP, for each substance reported on the TOP form. The substance misuse is categorised as abstinent if the number of days a substance has been used within the 28 days prior to the start TOP and the number of days a substance has been used within the 28 days prior to the most recent review or exit TOP is zero, for each substance reported on the TOP form.

Table 12.3: KPI 3 – Misuse of problematic substance reduced, abstinent or unchanged: by APB

TOP Reviews/Exits in period where problematic substance use is reduced, abstinent or unchanged (a)	Interview Year

- (a) The number of days the client has misused substances has reduced, remained the same or abstinent in the 28 days prior to the latest Review TOP/Exit TOP when compared with the number of days the client has misused the substance in the 28 days prior to the start TOP.
- (b) Percentage of all clients where substance use is reported in the 28 days prior to start TOP.
- (c) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.
- (d) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

Table 12.4 reports on KPI 4 Quality of life where Quality of life is improved or unchanged between the start TOP and the most recent review or exit TOP, for all clients aged 16 or over and within structured treatment. The quality of life score reported in the start TOP is compared with the corresponding quality of life score reported in the most recent review or exit TOP, and is reported as an improvement if the score within the most recent review or exit TOP is higher than or the same as the score reported in the start TOP.

Table 12.4: KPI 4 – Quality of Life Improved: by APB

TOP Reviews/Exits in period where quality of life is improved or unchanged (a)	Interview Year

(a) The Quality of Life score reported in the latest Review TOP/Exit TOP is higher than or the same as the Quality of Life score reported in the start TOP.

(b) Percentage of all clients where Quality of Life is reported in the start TOP

(c) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.

(d) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

Table 12.5 reports on clients who have completed treatment as either problematic substance free or where the client has reached their treatment goal(s) as agreed at the commencement of treatment, therefore only records that have a treatment date completed are included within this table. Clients who closed with a neutral outcome i.e. referred to another service; moved from area; prison/retained in custody; and moved to GP led prescribing are excluded from this table, along with inappropriate referrals as they are unlikely to have a treatment date.

Table 12.5: KPI 5 – Positive Treatment Closures (a): by APB

Treatment complete	Discharge Year									
	2015-16		2016-17		2017-18		2018-19		2019-20

(a) Excludes neutral closures: Referred to another service; Moved to GP Led Prescribing; Moved; and Prison

(b) Clients who complete treatment as percentage of all closures with a treatment date (minus neutral closures i.e. referred to another service, moved from area, prison/retained in custody and moved to GP led prescribing)

(c) Submissions are based on individual rather than referral and care must be taken when comparing activity. The treatment service providers within this area moved to a central reporting system. This resulted in records merging and a high number of closures where clients were transferred from individual treatment service providers into the central service.

(d) In April 2019, Bridgend moved from Western Bay APB to Cwm Taf Morgannwg APB

Table 12.6 shows the number of individuals who have been tested for Hepatitis C. This is the first year that this table has been reported on, and included in this report. It must be noted that due to the pandemic, the submission of the monthly data were suspended from 9th March 2020 to 24th June 2020, and the testing for Hepatitis C was put on hold.

Table 12.5: KPI 6 – Blood Borne Virus Test (a): by APB in 2019-20

	Test Year										
	2019-20										
	No. of clients currently showing on WNDSM	No. of new client referred to WNDSM	No. requiring HCV test	No. offered HCV test	%age offered HCV test	No. HCV tested	%age HCV tested	No. requiring no further HCV test	%age requiring no further HCV test	No. declining HCV test	%age declining HCV test

(a) Number of clients in treatment on the WNDSM as at 1st April 2019

(b) Number of clients assessed on the WNDSM but not yet commenced treatment as at 1st April 2019

(c) = a + b - h

(d) Number of clients showing on the harm reduction database with a last_test_date or last_declined_test_date between April 2019 and March 2020

(e) = d / c * 100

(f) Number of clients showing on the harm reduction database where the last_test_date_any_result is between April 2019 and March 2020

(g) = f / c * 100

(h) Number of clients showing on the harm reduction database where the further_testing_required field is blank

(i) = h / c * 100

(j) Number of clients showing on the harm reduction database where the last_declined_test_date is between April 2019 and March 2020 2019

(k) = j / d * 100

Annex A: Summary of Key Factors

Welsh National Database for Substance Misuse (WNDSM)

The database contains details of all referrals to Drug and Alcohol treatment service providers in Wales and is held by Digital Health & Care Wales (DHCW).

Coverage

The data relates only to people presenting to the treatment service providers and may constitute only a proportion of all substance misusers.

Data Quality

The data quality issues that affect this report can be found in [Section 3](#).

Data processing cycle

All Treatment Service Providers in receipt of Welsh Government funding, to deliver substance misuse services are required to comply fully with the reporting requirements of the database. The data in this annual report is derived from a “frozen” version of the database at 21st August 2020. NHS Wales Informatics Service process the data and prepare tables following this freeze date.

Comparisons between Annual Reports

The database is dynamic i.e. records are subject to amendment as further information is submitted by treatment service providers. This means that figures in this report are not directly comparable with those published in earlier reports.

Treatment Outcomes Profile

The Treatment Outcomes Profile (TOP) was developed by the National Treatment Agency (NTA) in collaboration with Dr John Marsden and Dr Michael Farrell of the National Addiction Centre, Institute of Psychiatry, Kings College, London.

The items that appear in the TOP were psychometrically evaluated and demonstrated an acceptable level of reliability and validity. This evaluation is available in the peer review journal *Addiction*. The abstract, and reference to the full article together with the background information about the Treatment Outcome Profile are available from: <http://www.nata/nhs.uk/who-healthcare-top.aspx>

The information presented covers all recorded start, review and exit TOPs recorded on the database since April 2009 when the tool was first adopted in Wales.

Disclosure and confidentiality

The risk of disclosing information about an individual has been considered for this WNDSM dataset and with the current level of aggregation is considered to be very low.

Users and Uses

We believe the key users of these statistics are:

- Ministers and their advisors;
- Assembly Members and Members Research Service in the National Assembly for Wales;
- Substance Misuse Treatment service providers;
- Area Planning Boards (APBs);

- Community Safety Partnerships (CSPs);
- Regional Partnership Boards (RPBs);
- Public Services Board (PSBs);
- Substance Misuse Advisory Regional Teams (SMARTs);
- Communities and Local Government;
- Local government unitary authorities (elected members and officials);
- Students, academics and universities;
- Other areas of the Welsh Government;
- Other government departments; and
- Individual citizens and private companies.

The statistics are used in a variety of ways. Some examples of these include:

- Advice to Ministers;
- To assess treatment services performance against targets;
- To inform service improvement projects for areas of focus and opportunities for quality improvement.

Annex B: List of Referral Source Groups

Referral Source Group	Referral Source
Criminal Justice System	Court
	Integrated Offender Interventions Service/Drug Interventions Programme/Arrest Referral Scheme
	Police
	Prison/Counselling Assessment Referral Advice and Through care, Transitional Support Scheme
	Probation Service to include Drug Rehabilitation Requirements
	Solicitor
	Youth Offending Team
NHS	NHS Accident & Emergency
	NHS Other
Other	Armed Forces
	Community Care Assessment
	Community Psychiatric Nurse/Community Mental Health Team
	Domestic Abuse Support
	Educational Establishment
	Employment Service
	Family/Friends
	Job Centre
	Midwife
	Needle/Syringe Exchange Scheme
	Peer Mentoring Scheme
	Psychiatry
	Social Services
	Support Agencies

Source: WNDISM, NHS Wales Informatics Service

Annex C: Definitions

The following definitions are used within this report:

Area Planning Boards (APBs)

Area planning Boards are responsible for the regional, (local health board footprint) commissioning of substance misuse services. Further information can be found at:-

<https://gov.wales/commissioning-substance-misuse-services-revised-guidance>

Drugs

The term “drugs” includes illegal drugs, misuse of legal prescriptions and over the counter medicines and solvent abuse.

Main problematic substance

The term “main problematic substance” refers to the main substance that led the client to seek help or be referred for help; note that many clients categorised under “alcohol” may also be receiving treatment for drugs and vice versa.

“Other Drugs”

This category is referred to in several tables and includes the following:

Methylphenidate, Methadone, Methylone, Minor Analgesics, Zopiclone, Major Tranquilisers Unspecified, Areca Nut, Antabuse, Acamprosate Calcium (Campral), GHB/GBH, Other Psychoactive Drugs Unspecified, Anti-depressant, NPS Predominantly Cannabis, NPS Predominantly Sedative, NPS Predominantly Stimulant, Other Sedatives, Phenteramine, Naltrexone, Zolpidem Tartrate, Antipsychotic Unspecified, Appetite Suppressant, Sedatives Unspecified, Barbiturates Unspecified, Nicotine, Khat, Drug Not Otherwise Specified, Ecstasy and Prescribed Drugs.

“Other Opiates”

This category is referred to in several tables and includes the following:

Buprenorphine, Opiates Unspecified, Codeine Unspecified, Dihydrocodeine, Tramadol Hydrochloride, Codeine Tablets, Morphine Sulphate, Opiate Comp Analgesics, Other Opiates, Oxycodone, Opium, and Fentanyl.

“Other Stimulants”

This category is referred to in several tables and includes the following:

Mephedrone, Stimulants Unspecified and Other Stimulants.

Clients referred

Refers to clients who were referred between April 2005 and March 2020. If more than 8 weeks elapsed between the end of a course of treatment and the start of a new course, then the client is counted again.

Structured treatments

Includes inpatient detoxification, community detoxification, residential rehabilitation, substitute opioid prescribing and psychosocial interventions.

Less structured treatments

Includes counselling/support e.g. crisis intervention and information only. (From 2011-12 this was revised to include practical/social support, complimentary/alternative therapies and diversionary activities, brief interventions and harm reduction.

Rate

Rate per 100,000 population based on ONS 2019 mid-year estimates published June 2020.

Median Age

The median is the middle number in a sorted list of numbers, i.e. the value where there are the same number of values below the median point as there are above it. For example, with a list of nine people with different ages, to find the median point you would follow the calculation $(9+1) \div 2 = 5$. So the median age of the group would be the age of the fifth person in the sorted list – where there are 4 people younger and 4 people older.

European Age-Standardised Rates (EASR)

The most comprehensive way of comparing the disease experience of two populations is to present and compare their age-specific rates. However, when the number of populations being compared increases, the volume of data that needs to be considered quickly becomes unmanageable. What is needed is a single, easily interpreted, summary figure for each population that is adjusted to take into account its age structure. Such summary figures are calculated using age standardisation methods.

One method of calculating a summary figure is 'direct standardisation'. The age-specific rates of the subject population are applied to the age structure of the standard population. This gives the overall rate that would have occurred in the subject population if it had the standard age-profile.

The European Standard Population (ESP) is often used for direct standardisation. This is a hypothetical population structure which does not change and is the same for both genders. This report uses the 2013 ESP, published by Eurostat. Detailed information and guidance on the 2013 ESP has been published by the UK's Office for National Statistics and can be found here: <http://www.ons.gov.uk/ons/guide-method/user-guidance/health-and-life-events/revised-european-standard-population-2013--2013-esp-/index.html>.

Treatment Outcome Profiles (TOPs)

These profiles measure the changes in client characteristics at regular intervals during treatment and at closure. The summary statistics on treatment outcomes included in this report utilise information gathered at the start of treatment (Start TOPs) and at subsequent review which are done generally every three months (Review TOPs), usually as part of a care plan review and at discharge (Exit TOPs). More information on the introduction of TOPs is available from: [Substance Misuse Documentation - Digital Health and Care Wales \(nhs.wales\)](#)

Treatment Modalities

A description of the treatment modalities can be found in Appendix 1 of the latest Business Definitions Guidance, found at: [Substance Misuse Documentation - Digital Health and Care Wales \(nhs.wales\)](#)

Key Performance Indicators

The revised suite of indicators became operational from July 2012. Since implementation, the Welsh Government has been monitoring these performance indicators and has refreshed guidance in view of operational experience.

Further information can be found at: [Substance Misuse Documentation - Digital Health and Care Wales \(nhs.wales\)](#)
