# Background

## Introduction

In September 2020 Welsh Government began sampling wastewater from 19 Wastewater Treatment Works (WwTW) from across Wales in order to detect the levels of SARS-CoV-2. Since then the programme has undertaken work not only to expand the coverage of the wastewater monitoring but also to improve the testing methodology to make it more representative of the catchments served.

Welsh Government intends to monitor up to 50 WwTW catchments across Wales in order to assist in the early detection of changing viral levels and the potential scale of outbreaks to help inform any public health action taken in the management of the pandemic and beyond.

## Methods

Wastewater-Based Epidemiology (WBE) provides comprehensive public health information at a community level. To achieve this, wastewater samples are collected at the inflow of sewage treatment plants across Wales. The samples are then analysed to determine the levels of specific pathogens, as well as summarising their physico-chemical characteristics. This data is then mapped against known infection rates and other public health indicators at the regional level.

Individuals with COVID-19 shed SARS-CoV-2 genetic material in their faeces in the form of ribonucleic acid (RNA), regardless of whether they have symptoms or not. Measurements quantify the amount of viral RNA present in wastewater alongside the presence of different mutations associated with SARS-CoV-2. This information therefore provides a representative and unbiased snapshot of the level of COVID-19 infection within a community at any point in time. In summary, WBE has the potential to act as key capability to aid in the surveillance and control of COVID-19.

Currently, a mixture of 'composite' and 'spot' samples (each comprising 1 litre of wastewater) are collected from each WwTW 5 times a week, Monday to Friday. Spot samples are taken at the same time each day to capture peak flow, while composite samples are collected over a 24-hour period at 15-minute intervals using automatic sampling machines. Welsh Government currently investigates levels of COVID-19 in wastewater at 47 sites across Wales within the Dŵr Cymru Welsh Water (DCWW) and Hafren Dyfrdwy networks.

## SARS-CoV-2 Quantification

The reported SARS-CoV-2 wastewater data is the concentration of viral gene copies (gc) detected in the wastewater sample. The viral copy number is obtained using an average of measurements from a single N1 nucleocapsid gene.

Samples are collected from the WwTW and transported at 4°C to laboratories on the day of collection. Samples are clarified to remove solid faecal matter and are subject to a PEG (polyethylene glycol) precipitation process. The quantity of a SARS-CoV-2 RNA present in the wastewater sample is then determined using a RT-qPCR (reverse transcriptase quantitative polymerase chain reaction) laboratory method.

Figure 1 - Process diagram

## Data Processing and Modelling

The total amount of SARS-CoV-2 RNA in the sample is corrected for various factors as a result of the RT-qPCR analysis, giving a raw copy number for each target gene. The data is reported as SARS-CoV-2 gene copies per litre (gc/L).

Most sewers in Wales are combined systems that collect waste waters (domestic, industrial, etc.) and stormwater from flooding and rainfall. As such, the collected wastewater samples vary through time and across WWTW. In particular, a sample's dilution can depend on the amount of rain that day. Each WWTW in Wales services a sewage network of different size and population.

The data is 'normalised' to account for variations in dilution and population. To adjust specifically for dilution, we have developed a method for recovering daily flow that is based on daily measures of flow indicators (Ammonium, Electrical conductivity, Orthophosphate concentrations) and dry weather flow. The serviced population at each wastewater site is estimated using the latest ONS population data for its drainage area. With these measures of daily flow dilution and population, we can then report the SARS-CoV-2 signal as a daily rate of gene copies per 100,000 people (gc/day per 100k). This value is then comparable across all the Welsh catchments. Day-to-day variability is smoothed using weekly averaging of the data.

In addition to normalising the data, the data are also studied for samples that could be deemed as 'outliers' on account of being significantly outside of the range of other recent samples. True outliers are then removed from datasets as they could have a negative impact on the trends observed in the figures produced for this report.

# Using this Report

Wastewater monitoring is a type of environmental monitoring, so it is difficult to model data around local authorities or health boards. Sewer catchments can receive rainfall or environmental sources of water from anywhere within their relevant geography, which follows the topography of the land. Sewer networks are managed around regions that mostly correspond with river drainage basins and it is these management areas that have been chosen for wastewater regional reporting.

For both National and regional rolling averages the population of all catchments is taken into consideration when reporting the signal per 100,000 people. For example, in Region 4 there are two catchments: one with a population of approximately 400 and the other with a population of approximately 67,100. Individual catchment populations are detailed in Appendix A.

All data relating to wastewater signal (SARS-CoV-2 gc/day per 100k) is represented as an exponential figure ( $\times 10^{12}$ ) where  $1 \times 10^{12} = 1,000,000,000,000$  unless otherwise stated. The report uses a mixture of line graphs and spark charts; both are based on 10 day rolling averages.

Maps of individual sewer catchments are located in the appendix of this report. Each section of the report contains a map that represents the area that is covered by the region.

Each regional summary is given in the format:

- The trend within the region for the previous four weeks
- The trend within the region compared to the previous week
- Any indicators triggered for the region
- Any inconsistencies or issues in the region

To allow for noise in wastewater signal we only record changes greater than 10% to be decreases or increases.

Samples below the limit of detection (LOD) are treated as half the LOD to enable full analysis to be recorded. Therefore, the LOD samples will not be identified on a case-by-case basis on the regional situation reports.

Please note that the data collection from the COVID-19 Infection Survey (CIS) has now finished and Appendix B - ONS COVID-19 Infection Survey vs Wastewater National Mean removed. UK Health Security Agency is working with ONS and the devolved nations, including Wales, to develop a new health monitoring survey which will include community surveillance of flu and other viruses as well as SARS-CoV-2.

Any questions on the report, or the Welsh Government Wastewater Programme, can be sent to [wastewater@gov.wales](mailto:wastewater@gov.wales).

## Alerting Indicators

To highlight potentially concerning changes in wastewater signal, the three following types of alerting indicators are assessed once a week, based on the viral load (gc/day per 100k) measured. The indicator table in the National situation report indicates the number of sites within those regions that have triggered the indicators:

1. The **High Signal Level** indicator highlights the catchment areas where the viral load is high. It corresponds to a situation where the viral loads exceed half of the highest weekly average recorded in the previous 6 months.
2. The **Rapid Increase** indicator highlights the catchment areas where the viral loads have rapidly increased for the last week compared to the previous week. It corresponds to a situation where the weekly average of the viral load has increased by at least 100% since the previous week.
3. The **Increasing Signal Level** indicator highlights the catchment areas where the viral loads are showing signs of continuous increase. It corresponds to a situation where the weekly average of the viral load has increased since the previous week for at least 3 weeks in a row.

**'0'** corresponds to no alerts present for the region or site, whilst **'-'** represents no data being available.

To assist in locating which region is relevant for a particular Health Board or Local Authority they are broken down in the tables below.

# Wales Situation Report

**Since the last report, SARS-CoV-2 viral load has decreased across the country. The signal decreased in 8 regions, remained level in 3 regions, and increased in 3 regions.**

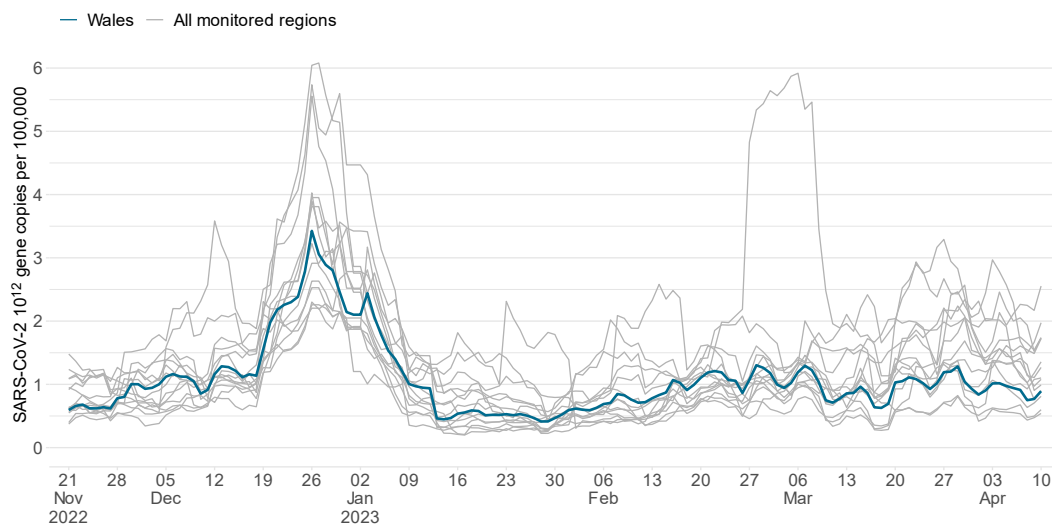

Figure 2 - National (blue lines) and Regions (grey lines) Rolling Mean SARS-CoV-2 gc/day per 100k

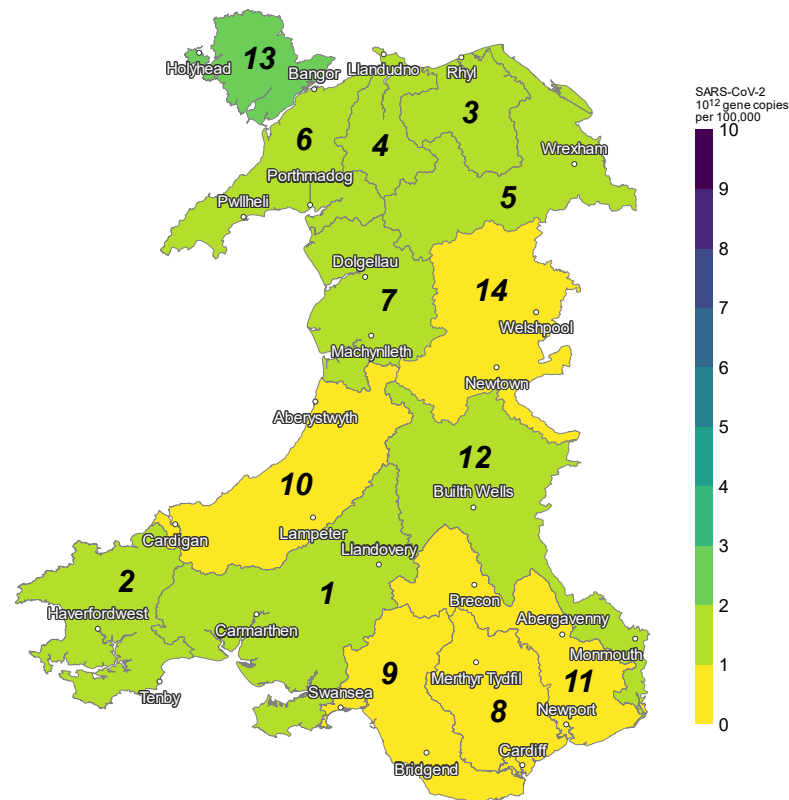

Figure 3 - National Heat Map showing Regional Mean SARS-CoV-2 gc/day per 100k

## Wastewater Monitoring in Wales – Weekly Report

### Wales Situation report:

- The trend in the national mean wastewater signal has been unstable, with both increases and decreases over the last four weeks.
- Since the last report, SARS-CoV-2 viral load has decreased across the country. However, the signal remained level at Carmarthen Bay and the Gower, Dee and South East Valleys, and increased at Conwy, Meirionnydd and Ynys Môn.

Region name	Number of sites monitored	% regional population covered	No. sites with High Signal Level	No. sites with Rapid Increase	No. sites with Increasing Signal Level
<b>Region 1: Carmarthen Bay and the Gower</b>	4	57	0	0	0
<b>Region 2: Cleddau and Pembrokeshire Coastal Rivers</b>	4	39	0	0	0
<b>Region 3: Clwyd</b>	2	54	0	0	0
<b>Region 4: Conwy</b>	2	82	0	0	0
<b>Region 5: Dee</b>	4	46	2	0	0
<b>Region 6: Llŷn and Eryri</b>	4	34	0	0	0
<b>Region 7: Meirionnydd</b>	3	28	0	0	0
<b>Region 8: South East Valleys</b>	2	82	0	0	0
<b>Region 9: Tawe to Cadoxton</b>	5	73	0	0	0
<b>Region 10: Teifi and North Ceredigion</b>	3	30	0	0	0
<b>Region 11: Usk</b>	4	86	0	0	0
<b>Region 12: Wye</b>	4	36	1	1	0
<b>Region 13: Ynys Môn</b>	3	37	0	0	0
<b>Region 14: Hafren Dyfrdwy</b>	3	26	0	0	0

### Region 1 situation report:

- Wastewater signal in the region has been unstable, with both increases and decreases over the last four weeks. However, the overall signal change in that period is a decrease.
- Compared with last week, the signal has remained level across the region. However, the signal decreased at Garnswilt and Llanelli Coastal, and increased at Gowerton.
- No indicators were triggered during the last reporting period.
- There were two samples missing from each of the sites in the region.

“-“ Indicates where no data is available. This could be as a result of no samples being taken or missing metadata.

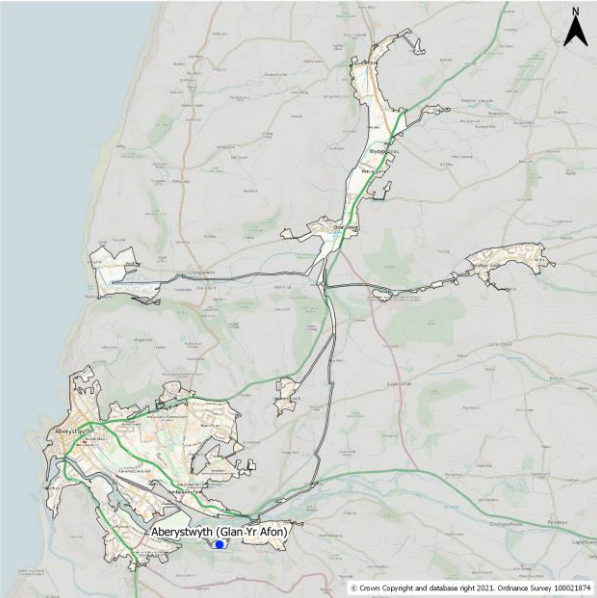

“Mixed” is used to indicate the weekly mean is made up of both spot and composite samples.

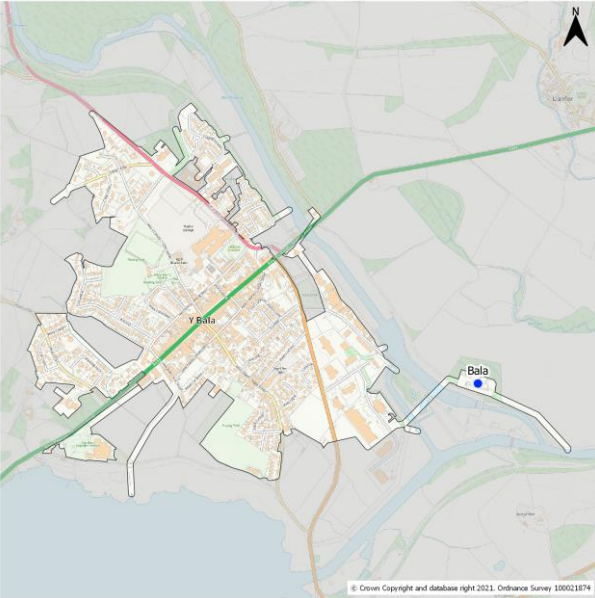

# Appendix B – Sewer Catchment Maps

The maps featured in this report may not be used or reproduced without permission from our relevant partners, Dŵr Cymru and Hafren Dyfrdwy.

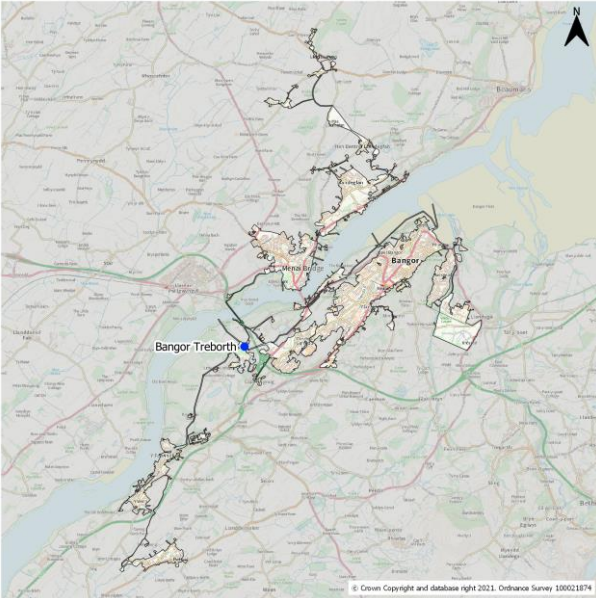

Maps are reproduced in alphabetical order and have been provided to give context to the physical sewer areas of the monitored wastewater catchments used in this report.
